

A call to action for individuals and their communities

2016

America's Health Rankings[®] and America's Health Rankings[®] Senior Report were built upon the WHO definition of health: "Health is a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity."

Our model reflects that determinants of health directly influence health outcomes, with determinants accounting for three-quarters and outcomes accounting for one-quarter of each state's overall score and ranking. Four categories of determinants are included in our model of health: Behaviors, Community & Environment, Policy, and Clinical Care.

America's Health Rankings® Senior Report

Executive Summary

The 2016 *America's Health Rankings® Senior Report* provides a comprehensive analysis of senior population health on a national and state-by-state basis across 35 measures of senior health. Now in its fourth year, it continues to serve as a resource for individuals, community leaders, policymakers, public health officials, and the media to benchmark each state's performance on the key measures of health and wellness for the senior population.

Major Projected Population Growth, Coupled with Anticipated Higher Rates of Obesity and Diabetes among Today's Middle-Aged Population Threatens to Place Future Strain on the Health Care System

Building on the traditional state rankings, this year the report took an in-depth look at today's middle-aged population who will age into senior status (65+) over the next 14 years and examined how the challenges of that generation will impact the senior population. The analysis compared health measures for the middle-aged population (aged 50-64) in 1999 to the same measures for the middle-aged population as of 2014.

Growth in the senior population will vary among states, from a low of 33.4% in New York to a high of 85.1% in Alaska by 2030. Twenty-five states are projected to see increases greater than 50% in their senior population by 2030.¹

Overall, this population smokes less, but will be entering their senior years with higher rates of obesity and diabetes and lower rates of very good or excellent health status, putting significant strain on the health care system. Compared to the current senior population when they were middle-aged, the next wave of seniors:

- Smokes 50% less;
- Has a 55% higher prevalence of diabetes;
- Has a 25% higher prevalence of obesity;
- Has a 9% lower prevalence of very good or excellent health status.

Six states are poised to face a 50% or greater increase in the number of seniors by 2030, coupled with an 80% or greater increase in the prevalence of diabetes versus the current population of seniors when they were middle-aged. Among these states, Colorado will experience a 138% increase in the prevalence of diabetes in its senior population by 2030. While Colorado's baseline diabetes prevalence was lower than the national average, the triple-digit

increase over 14 years is nonetheless startling.

Growing obesity rates will also pose a challenge to states — with 11 states poised to face a 50% or greater increase in the number of seniors by 2030, coupled with a 20% or greater increase in the rate of obesity versus the current population of seniors when they were middle-aged. The prevalence of obesity among current middle-aged individuals in Arizona is 96% higher than when the current population of seniors was middle-aged — the most dramatic increase of any state.

These higher rates of diabetes and obesity are expected to put significant strains on the Medicare program and the overall health care system. For example, today one out of every three Medicare dollars is spent on diabetes-related care, and research indicates that between 2009 and 2034, Medicare spending on diabetes is projected to rise from \$45 billion to \$171 billion.^{2,3} Diabetes is also associated with potentially serious complications that contribute to additional use of health resources and poor health status for the nation's seniors. Hospitalizations, heart attacks, kidney failure, and hearing loss are all more common in seniors with diabetes.⁴

Similarly, higher rates of obesity also likely signal higher rates of future spending and poor health. Of total annual Medicare spending, 8.5% is associated with obesity-related care and Medicare spends 36% more per beneficiary on obese seniors compared to those at a healthy weight.⁵ Complications associated with obesity leading to poor health include diabetes, heart disease, high blood pressure, and other chronic conditions.⁶

Today's middle-aged population may also be unprepared for the financial impact of declining health status. Recent research has found that out-of-pocket health care costs for individuals younger than age 65 with diabetes are 2.5 times higher than for individuals without diabetes.⁷ Further, a recent Government Accountability Office study found that among households aged 55 and older, 29% have no retirement savings or defined benefit savings plan. While middle-aged Americans plan to retire later or continue working during retirement at a higher rate than current seniors to close the gap in savings, chronic diseases could challenge these plans.⁸

Successes and Challenges in Senior Health

Each year *America's Health Rankings® Senior Report* enumerates the strengths, challenges, and

highlights of every state to support communities across the nation in taking data-driven action to improve health. It also compares this year's key indicators to past performance, revealing where the nation as a whole has improved and in which areas it continues to struggle.

National successes over the past year include a 9% decrease in preventable hospitalizations and an 8% decrease in the prevalence of full-mouth teeth extractions. Hip fractures decreased 5% from 6.2 to 5.9 hospitalizations per 1,000 Medicare beneficiaries.

Looking at a longer time frame, successes over the past three years include:

- 18% increase in the availability of home health care workers
- 40% increase in hospice care use, and
- 29% decrease in hospital deaths.

Health status has also improved during this time frame, with 7% more seniors reporting very good or excellent health compared to three years ago.

While these data are encouraging, challenges for senior health remain. Specifically, over the past year the nation has witnessed:

- 7% decrease in community expenditures given to seniors living in poverty,
- 7% decrease in home-delivered meals,
- 5% increase in food insecurity, and
- 10% decrease in the reach of Supplemental Nutrition Assistance Program (SNAP).

Over the past three years, obesity among seniors has increased 9%, which is higher than the increase in the general population of 6%.

Rankings Reveal Healthiest States & States with Greatest Opportunities for Improvement

Massachusetts tops the list of healthiest states for older adults, rising from sixth place last year. The state saw success in reducing physical inactivity by 12% and smoking by 20%, but also saw a decrease of 13% in flu vaccination coverage. Rounding out the healthiest states for seniors are Vermont (2), New Hampshire (3), Minnesota (4), Hawaii (5), and Utah (6).

Louisiana ranked as the least healthy state for seniors again this year, as it continues to struggle with a high prevalence of smoking, obesity, and physical inactivity. The state does receive strong marks in flu vaccination coverage, low prevalence

of falls, and the availability of home health care workers. Compared to last year, seniors in the state have had 12% more annual dental visits and 29% fewer full-mouth teeth extractions. Oklahoma (49), Mississippi (48), Arkansas (47) and West Virginia (46) round out the states with the greatest challenges for senior health.

Several states also saw significant improvements over the last three years. Rhode Island jumped from 30th to 11th in the rankings, with key improvements including a 24% decrease in preventable hospitalizations, 23% decrease in smoking, and 18% increase in seniors reporting very good or excellent health status. Alaska improved from 39th to 21st, with a 27% decrease in hip fractures and 16% reduction in poverty contributing to the improved ranking. Finally, New Jersey jumped 12 places from 28th to 16th — due in part to a 19% decrease in hip fractures and 10% increase in volunteerism. All three states made strides to decrease food insecurity and hospital deaths over the past three years.

Supporting Public Health Efforts for Seniors Today & Tomorrow

Seniors have a significant impact on the US health care system and understanding their health, as well as the health of the next wave of seniors, helps improve the country's public health efforts. With this report, United Health Foundation seeks to increase understanding of the challenges and opportunities related to the current and future state of health of older Americans, all while supporting communities, governments, stakeholders and individuals to take action to improve senior health.

Introduction

America's Health Rankings® Senior Report offers a comprehensive analysis of senior population health on a national and state-by-state basis across 35 measures of senior health. Now in its fourth year, the report serves to:

1. Help states prepare for the rapid growth of their senior population. The US senior population is projected to grow 49.5% by 2030. The senior growth rate varies from 33.4% in New York to 85.1% in Alaska. This surge along with the increasing rates of obesity, diabetes, and other chronic diseases are poised to overwhelm our health care system.
2. Provide a benchmark of state senior health. State level data allow states to monitor trends over time and to compare senior health measures with other states and the nation.
3. Stimulate discussion and action. The report's purpose is to kindle and continue to fuel dialogue among individuals, community leaders, policymakers, public health officials, and the media by providing accurate, reliable, and trustworthy information based on a holistic view of health.

Selection Process for the 35 Measures

The selection of the 35 measures that make up *America's Health Rankings® Senior Report* is driven by these five factors:

1. The overall measures represent a broad range of issues that affect senior health.
2. Individual measures meet commonly accepted health-measurement criteria.
3. Data are available at the state level.
4. Data are current and updated periodically.
5. The aspect being measured is amenable to change.

While imperfect, these 35 measures are some of the best available indicators of the various aspects of senior health. An additional seven supplemental measures are provided that provide further context to more fully describe the population health.

Each year *America's Health Rankings® Senior Report* enumerates the strengths, challenges, and health highlights of every state to start a shared discussion. The measures used to define health are dependent on each other and intermingled in every aspect of what we do, where we live, care we receive, and outcomes we experience. Example: A community's effort to reduce physical inactivity could affect obesity, management of joint pain, frequency of falls, effectiveness of diabetes management, etc.

This year, the report looks ahead at the challenges that will impact the senior population in the next 15 years. Not only will the next generation of seniors rapidly grow in numbers, but the next group of seniors are projected to have higher rates of obesity and diabetes and a lower rate of excellent or very good health status. The good news is they smoke less than the current generation of seniors.

This report builds an informational base and creates awareness — the vital step is to take action. Select a state (<http://www.americashealthrankings.org/states>) to learn more. Visual tools, such as Core Measure Impact (Measures tab) and Change My Rank, are available to illustrate which health measures have the greatest impact on each state rank.

FIGURE 3

Future Wave of Seniors (Adults aged 50–64 in 2014 and 1999)

Compared to the current senior population when they were middle-aged, the next wave of seniors:

Smokes 50% less

Has a 55% higher prevalence of diabetes

Has a 25% higher prevalence of obesity

Has a 9% lower prevalence of very good or excellent health status

The US senior population is projected to grow 49.5% by 2030.

Findings

Several items are noteworthy when reviewing the changes in senior health over the past year. The nation as a whole has experienced successes and challenges. Successes include:

- A 9% decline in the rate of preventable hospitalizations from 59.3 to 53.8 discharges per 1,000 Medicare beneficiaries,
- An 8% reduction in the prevalence of full-mouth teeth extractions from 16.1% to 14.9% of adults aged 65 and older, and
- A 5% decrease in hip fractures from 6.2 to 5.9 hospitalizations per 1,000 Medicare beneficiaries.

Challenges include:

- A 7% decrease in community support from \$873 to \$811 per adult aged 65 and older in poverty,
- A 7% decrease in home-delivered meals from 20.6% to 19.1% of seniors in poverty,
- A 10% decrease in the reach of the Supplemental Nutrition Assistance Program (SNAP) from 75.2% to 67.4% of seniors in poverty, and
- A 5% increase in food insecurity from 14.8% to 15.5% of adults aged 60 and older.

Now in its fourth edition, successes and challenges can be examined over a three year timeframe. Three year successes include:

- An 18% increase in home health care workers from 93.8 to 110.6 workers per 1,000 adults aged 75 and older,

- A 40% increase in hospice care use from 36.7% to 51.4% of decedents aged 65 and older,
- A 29% decrease in hospital deaths from 30.1% to 21.5% of decedents aged 65 and older, and
- A 7% increase in health status from 38.4% to 41.2% of adults aged 65 and older reporting very good or excellent health.

Looking at changes over the last three years also accents a major challenge facing the senior population, a 9% increase in obesity from 25.3% to 27.5% of adults aged 65 and older. This compares to a 6% increase in obesity in the general population over the same time period.

Maintaining and improving the health of seniors is challenged by two factors; the rapidly increasing number of individuals in this age group and the healthiness of the individuals moving into this age group. By 2030, the number of seniors is projected to increase by 49.5% from approximately 49,360,000 in 2016 to 73,789,000 in 2030.¹ The future cohort of seniors (adults aged 50–64 years in 2014) differ from the current cohort of seniors (adults aged 50–64 years in 1999) 15 years ago. Compared with the current cohort of seniors, the prevalence of smoking is half among the future cohort, but the prevalence of obesity is 25% higher, the prevalence of diabetes is 55% higher, and the percentage reporting very good or excellent health is 9% less (Figure 3). Over the next 15 years, the health of this population will be challenged by large numbers of new people becoming seniors and the additional health challenges, such as diabetes, that this groups brings with them.

1. The 2015 MSA Profile. Woods & Poole Economics, Inc. Washington, DC.

Senior Health Steering Group

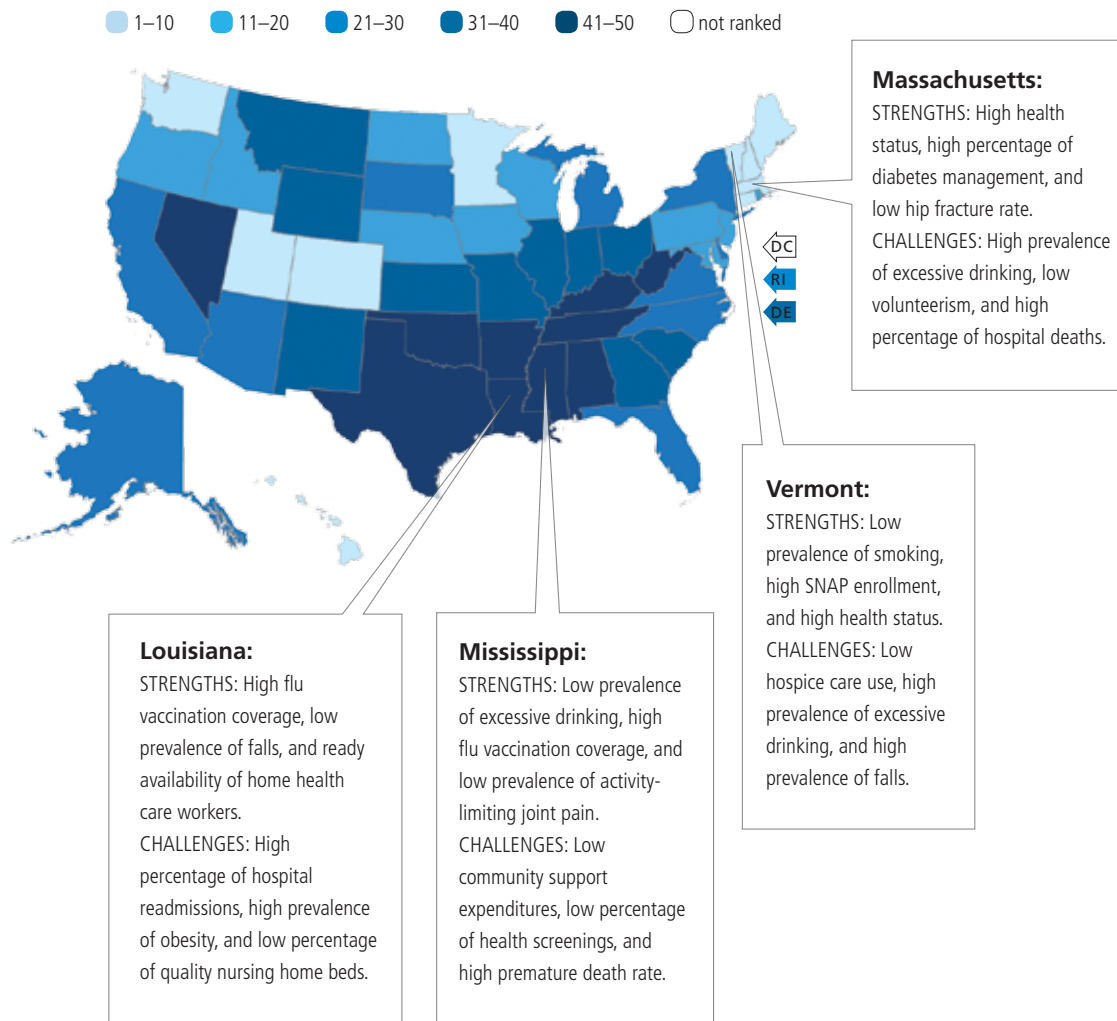

From its beginning, *America's Health Rankings® Senior Report* has had as its foundation and touchstone the Senior Health Steering Group (SHSG), a panel of experts in senior health. With the launch of the first report, the panel was charged with

- 1) identifying the areas of health and well-being most pertinent to older adults, and

- 2) creating a model for assessing population health at a state level.

Before each edition, the panel re-convenes to review the model and the measures. For more about the SHSG go to <http://www.americashealthrankings.org/about/senior?tabname=SeniorExpertPanel> or page 143.

FIGURE 4
2016 Ranking

Top and Bottom States

- Massachusetts tops the list as healthiest state for older adults (Figure 4, Tables 1 and 2). Smoking decreased 20% since last year, which moves Massachusetts up 20 places in the ranking of that measure. Physical inactivity decreased 12%. However, flu vaccination coverage decreased 13% in the last year.
- The top six states (Massachusetts, Vermont, New Hampshire, Minnesota, Hawaii, and Utah) are a step above the other states and are virtually tied for the top place in the rankings (Figure 5). These states are uniformly high among the outcome measures but show variation in behaviors, community & environment, policy, and clinical care.
- Louisiana is 50th again this year. The state's strengths are high flu vaccination coverage, low prevalence of falls and ready availability of home health care workers. A high prevalence of smoking, obesity, and physical inactivity remain yearly challenges. In the past year, annual dental visits increased 12% and full-mouth teeth extractions decreased 29%.
- Oklahoma, like Louisiana, is a step below the other bottom states. Kentucky, West Virginia, Arkansas, and Mississippi round out the bottom six states — these four states have similar overall scores (Figure 5) and are comparable in their senior health.

How to Use America's Health Rankings®

America's Health Rankings® Senior Report is about digging deeper, digesting data, and then doing something that will improve state health. The rankings are important, but they are only a starting point. Here are general guidelines about using the rankings if the state:

- Shows no change. Check the measures because it may be that there has been a notable change in one or more measures that has been offset by equally notable changes in the opposite direction by other measures. Or it may be that there have been changes but, relative to changes in other states, there's no change in the overall rank.
- Shows little change. Check the measures. A big shift in a measure or two may be masked by an abundance of smaller shifts with other measures.
- Shows big change. Again, investigate further to see what's driving the change.

The strengths, challenges, and highlights for each state are described on the state summary page in this book and on the website (www.americashealthrankings/senior/state).

Once the investigation is complete, use this information to take action.

FIGURE 5

Overall Score by State

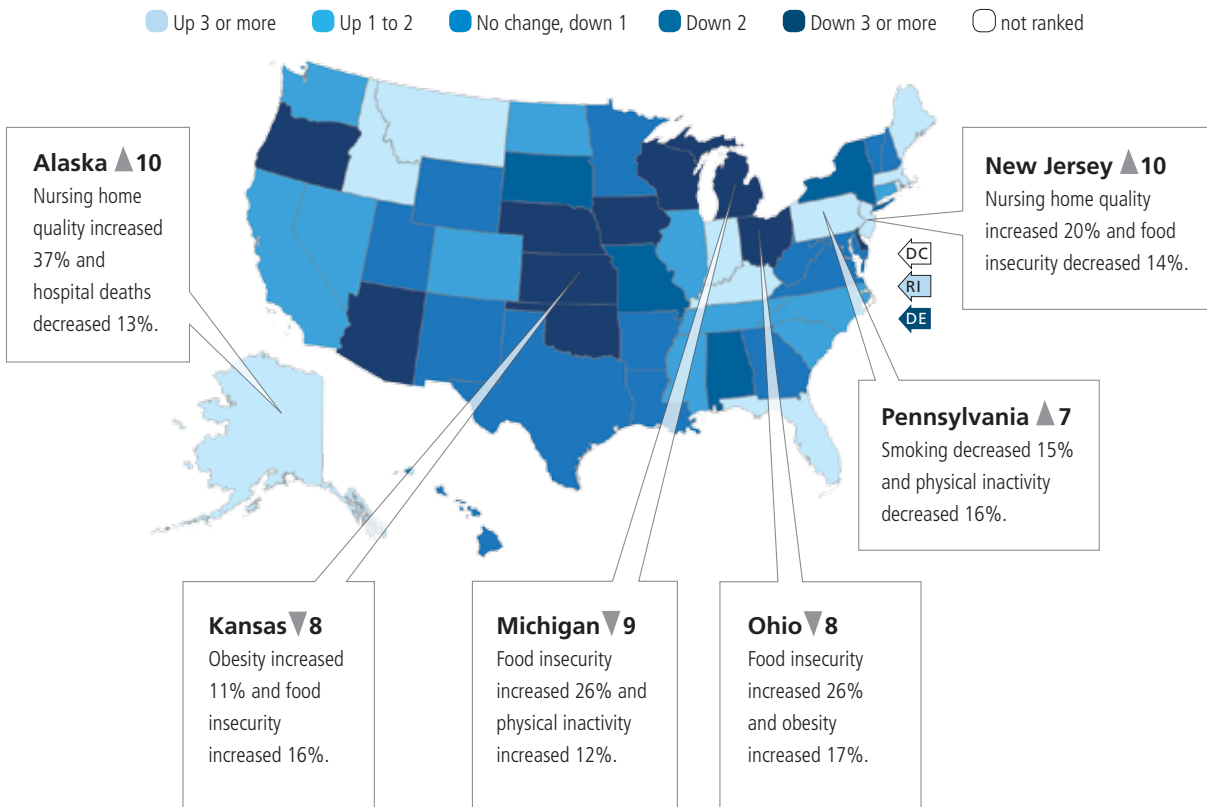

Figure 5 shows the overall score for each state (methodology page 140). It demonstrates that several states have similar scores with clusters around the top six ranks (Massachusetts, Vermont, New Hampshire, Minnesota, Hawaii, and Utah); around Washington, Rhode Island, Oregon, Wisconsin, and Maryland; around Alaska, Delaware, New York, and Florida; and around Kentucky, West Virginia, Arkansas, and Mississippi.

Findings

FIGURE 6
2015–2016 Change in Rank

Change in Rank

Alaska, New Jersey, and Pennsylvania saw the greatest improvements in rank from 2015, while Kansas, Michigan, and Ohio dropped in the rankings (Figure 6). Alaska climbed 10 places from 31st to 21st, with an increase in nursing home quality and decrease in hospital deaths. New Jersey also jumped 10 ranks from 26th to 16th, with an increase in nursing home quality and decrease in food insecurity. Pennsylvania jumped 7 places from 25th to 18th, with decreases in both smoking and physical inactivity. All three states that dropped in the rankings experienced an increase in food insecurity. Kansas and Ohio also experienced an increase in obesity, while Michigan saw an increase in physical inactivity.

Several states also saw notable improvements in the rankings over the past three years.

Rhode Island jumped from 30th to 11th, with improvements in preventable hospitalizations (24% decrease), smoking (23% decrease), and seniors reporting very good or excellent health (18% increase). Alaska improved from 39th to 21st, with a 27% decrease in hip fractures and 16% reduction in poverty. New Jersey also jumped from 28th to 16th, with a 19% decrease in hip fractures and 10% increase in volunteerism. All three states made strides in reducing food insecurity and hospital deaths over the past three years. Food insecurity decreased 44% in Alaska, 4% in New Jersey, and 18% in Rhode Island, while hospital deaths decreased 24% in Alaska, 31% in New Jersey, and 39% in Rhode Island.

Future Perspective

Population Growth Projections

In 2011 the oldest of the baby boomer generation turned 65, marking the beginning of a tremendous demographic shift in the US population.² By 2056, the population of adults aged 65 and older is projected to surpass the population younger than 18 years.³ Each day through 2030, 10,000 baby boomers will turn 65, which will place a heavy burden on the health care system.² Adults aged 65 and older are the largest consumers of health care as the process of aging brings upon the need for more frequent health care.⁴

Using population projections published by Woods and Poole in 2015, the senior US population is expected to increase by 49.5% between 2016 and 2030. This amounts to a projected annual growth rate of 3.5% in the 65 years and older population. In addition to projected increase in the aging population, the US population is expected to become more racially and ethnically diverse. The aggregate minority population in the United States is projected to become the majority by 2043.³ The projected growth of the senior population in the United States will pose challenges to policymakers, Medicare, Medicaid, and Social Security, not to mention the effect it will have on families, communities, businesses, and health care providers.

The pressure that this demographic shift places on the nation is not evenly distributed among the states (Table 3), with some states expecting many more aging baby boomers than others.

The senior population is projected to increase by more than 50% in 25 states. Table 3 includes the 10 states with the highest annual growth rate and the 10 states with the lowest annual growth rate in the 65 and older population from 2016 to 2030. The growth rate and the corresponding percent growth for all states are provided on the website (www.americashealthrankings.org/reports/senior?tabname=future).

TABLE 3

Projected Population Growth Among Adults Aged 65 and Older from 2016 to 2030, Top 10 States and Bottom 10 States

Top 10 States	Annual Growth Rate (%)	Total Increase (%)
Alaska	6.1	85.1
New Hampshire	5.0	69.7
Texas	4.7	66.3
Nevada	4.7	65.4
Wyoming	4.5	63.3
Vermont	4.5	63.1
Georgia	4.4	61.4
North Dakota	4.3	60.4
New Mexico	4.3	60.4
Colorado	4.3	59.6

Bottom 10 States	Annual Growth Rate (%)	Total Increase (%)
New York	2.4	33.4
West Virginia	2.4	33.9
Iowa	2.7	37.1
Ohio	2.8	38.6
Oklahoma	2.8	39.4
Pennsylvania	2.8	39.5
Illinois	2.9	40.0
Kansas	2.9	40.3
Missouri	2.9	41.2
New Jersey	3.0	41.4

Comparison of Health Estimates in the Middle-Aged Population, 1999 and 2014

Four health measures among the middle-aged (50-64 year olds) were examined for a broader context of the health of our nation and what's to come when viewed in conjunction with population growth projections. The prevalence of obesity, diabetes, smoking, and very good or excellent health status in middle-aged adults in 2014 were compared to middle-aged adults in 1999. Changes in these health indicators and the demographic shifts have significant, and largely unchangeable, impacts on the population's health.

With the increase in obesity and diabetes prevalence over the past 15 years, there has been a contemporaneous decrease in smoking prevalence. The percentage of adults aged 50-64 who smoke now is much less than the percentage in 1999. Self-reported health status has also experienced a modest decline.

The magnitude of change in obesity and diabetes prevalence between 1999 and 2014 in the middle-aged population demands our attention. Examining the estimated relative change can help states prepare for the expected economic, social, and health effects. Tables of obesity, diabetes, smoking, and health status prevalence among 50-64 year olds in 1999 and 2014, as well as the relative percentage changes for all states are available at www.americashealthrankings.org/reports/Senior?tabname=Future. See Appendix (page 141) for methodology.

Obesity

The national obesity prevalence in the middle-aged population increased 25% from 1999 to 2014. While all but one state's obesity rates have increased, they have not done so evenly. Idaho's rate increased the least at only 2%, while obesity rates in Arizona rose by 96%. In Colorado, the obesity rate of middle-aged adults decreased by 3% over the 15-year period.

Obesity contributes to a variety of other serious chronic diseases. States with higher obesity rates may presume further health challenges are ahead. Table 4 shows the top 10 states and bottom 10 states.

TABLE 4

Relative Change in Obesity Prevalence Among 50-64 Year Olds in 1999 compared to 2014, Top 10 States and Bottom 10 States

Top 10 States	1999 (%)	2014 (%)	Relative Change (%)
Colorado	26.9	26.1	-2.8
Idaho	31.8	32.4	2.0

Tennessee	28.3	38.5	36.4

Diabetes

Nationally, the prevalence of diabetes among the middle-aged population has increased dramatically from 1999 to 2014 with an almost 55% increase in the percentage of adults aged 50 to 64 who reported that a physician told them they had diabetes. This increase in diabetes prevalence is far more precipitous in some states than others, with nearly a 145% increase for middle-aged adults in Nebraska and a 138% increase in Colorado. Diabetes prevalence is estimated to double in six states. All states reported an increase in diabetes prevalence, with the smallest increase occurring in Montana with a single digit increase of 6%.

States with greater gains in diabetes prevalence can expect to face additional challenges over the coming years as a less healthy cohort of adults become seniors. Table 5 shows the top 10 states and bottom 10 states.

TABLE 5

Relative Change in Diabetes Prevalence Among 50-64 Year Olds from 1999 to 2014, Top 10 States and Bottom 10 States

Top 10 States	1999 (%)	2014 (%)	Relative Change (%)
Montana	11.0	11.7	6.3
Delaware	12.1	14.2	17.5

Arkansas	10.4	20.0	91.7
North Dakota	6.6	12.6	90.7

Smoking

Nationally, the prevalence of smoking in the middle-aged population decreased 50% from 1999 to 2014. The public's perception of the health risks associated with smoking have shifted over the past 15 years. Despite across the board decreases in smoking prevalence by state, there is some variation in the relative percentage change across states. Utah, Arizona, New Jersey, and Hawaii all achieved a percentage change decrease in smoking prevalence in the range of 61-67%. The relative change in the majority of other states fell somewhere between a 40-60% decrease in smoking prevalence. The smallest decrease occurred in Alabama where 31% fewer adults reported being current smokers in 2014 compared to 1999.

States with less steep declines and a higher prevalence of smokers compared to the national average can expect to face additional challenges over the coming years as the cost of chronic diseases associated with smoking are realized. The top 10 states and bottom 10 states are listed in Table 6.

TABLE 6

Relative Change in Smoking Prevalence Among 50-64 Year Olds from 1999 to 2014, Top 10 States and Bottom 10 states

Top 10 States	1999 (%)	2014 (%)	Relative Change (%)

North Carolina	35.5	20.6	-42.1
West Virginia	47.0	26.9	-42.8

Health Status

Nationally, the percentage of adults aged 50 to 64 reporting very good or excellent health has decreased by 9.4% from 1999 to 2014. This drop in health status is far more dramatic in some states than others, with 18-19% fewer adults in Indiana, Kansas, New Mexico, Louisiana, and Oklahoma reporting very good or excellent health. A few states reported a modest increase in health status, with the largest percentage increase occurring in North Dakota where 2.2% more adults reported very good or excellent health. Missouri had no change in self-reported health status since 1999.

States with greater declines can expect to face additional challenges over the coming years as a less healthy cohort of adults ages. Table 7 shows the top 10 states and bottom 10 states.

TABLE 7

Core Measures

Smoking

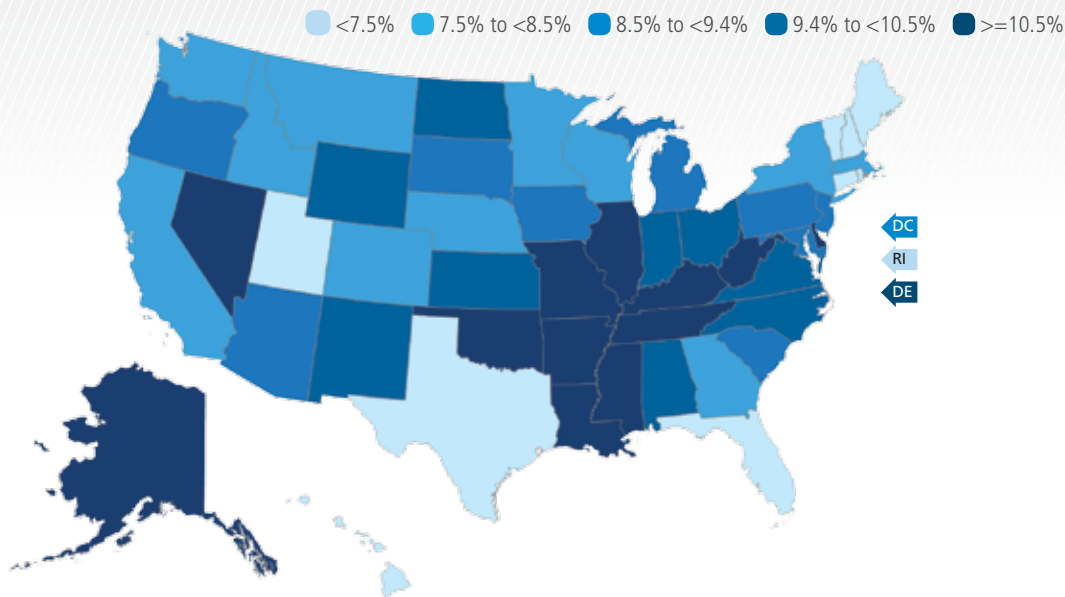

Smoking is the leading cause of preventable death in the United States. On average, nonsmokers live 10 years longer than smokers. Smoking damages nearly every organ in the body and causes cataracts, respiratory disease, heart disease, stroke, and cancer. Smoking is also associated with accelerated cognitive decline; past smoking is a risk factor for dementia and premature impairment. Cessation, even in older smokers, can have profound benefits on current health status as well as improve long-term outcomes. Smoking is estimated to cost \$300 billion yearly in direct health care expenditures and productivity losses.

Excessive Drinking

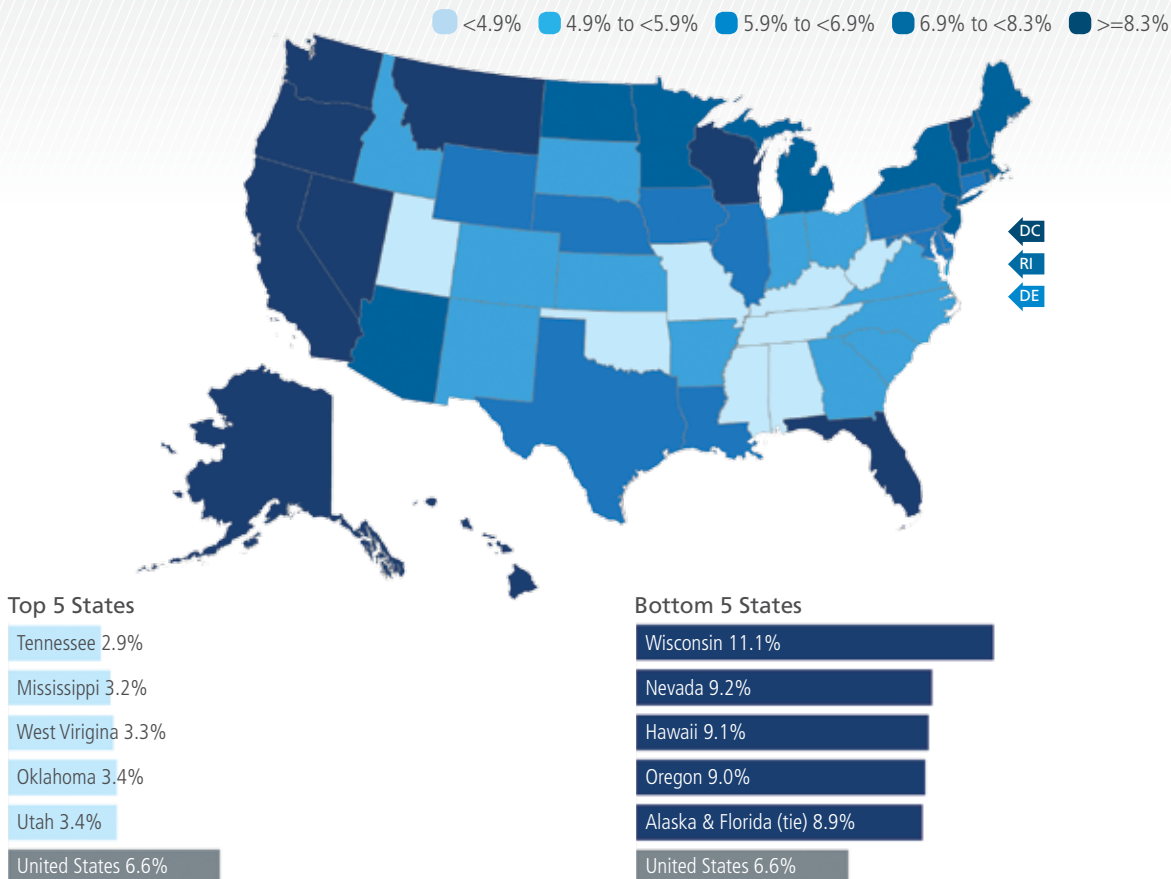

Excessive alcohol consumption is the United States' third-leading cause of preventable death. The attributable death rate due to excessive alcohol among seniors is double the rate of the general population. Excessive alcohol consumption in seniors can lead to sleep disorders, depression, anxiety, suicide, liver disease, cardiovascular disease, and cancer. Heavy drinking can exacerbate health problems such as diabetes and high blood pressure. Alcoholism is also a significant risk factor for dementia. Acute impairment from heavy drinking can cause unintentional injuries and deaths. Bereavement, loneliness, and social isolation may contribute to excessive drinking. In 2010 excessive drinking cost \$249 billion in the United States.

- find a support network
- make a plan
- don't keep alcohol at home
- recognize triggers
- slow the pace
- exercise
- find productive ways to handle stress
- fill your time with healthy activities
- drink water between alcoholic beverages
- set limits
- drive sober
- establish drinking rules
- never drink alone
- reward yourself for sobriety
- avoid heavy drinkers

Obesity

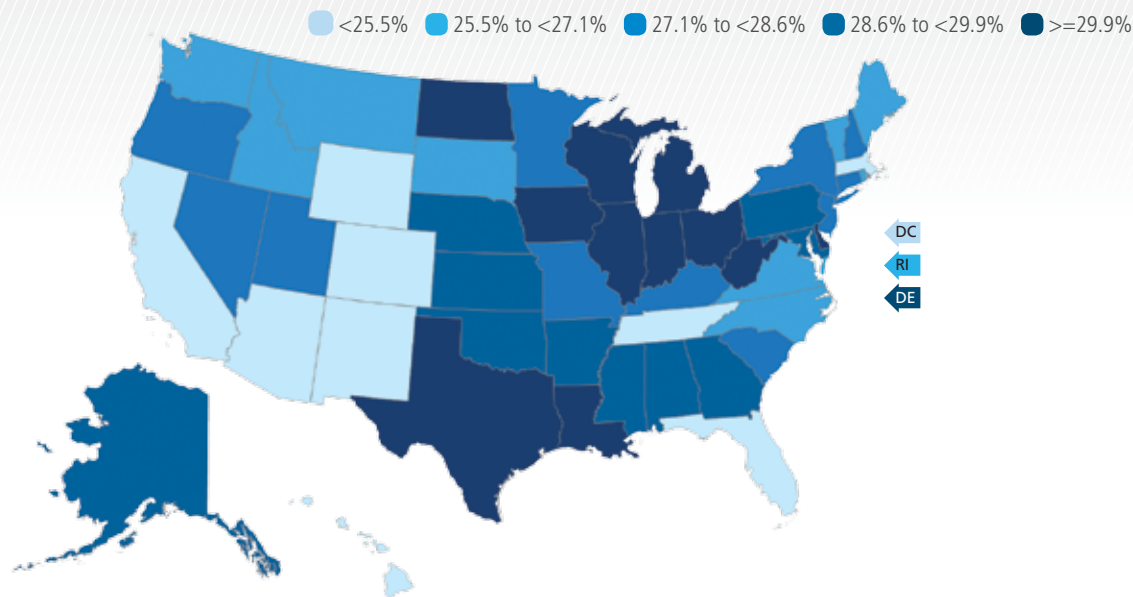

Obesity is a leading cause of preventable death that contributes to cognitive decline, heart disease, diabetes, stroke, and certain cancers; it may also lead to disability due to excess weight on joints. The effect of obesity on mortality risk increases significantly with age. Obese seniors experience more hospitalizations, emergency department visits, and use of outpatient health services than non-obese seniors, leading to higher health care costs. Physical activity, healthy diet, supportive communities and social networks, and an environment that encourages exercise all play a role in reducing obesity in older adults.

Underweight

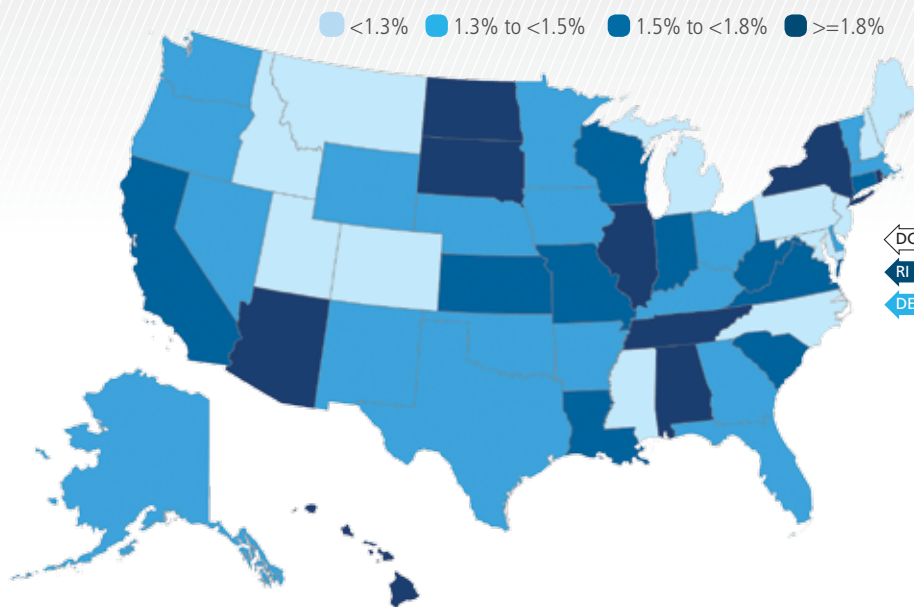

Underweight older adults may be frail, have more difficulties with activities of daily living, and need more caregiving assistance than older adults with healthy weight. They are at increased risk of acute illness and death. Poor nutrition is a main risk factor for being underweight. Social isolation, psychological disorders, poverty, physiological function, medications, and poor oral health are all factors that put older adults at an increased risk of being undernourished. Community meal services, education for adults at risk of being underweight, encouraging physical activity, and nutritional management training for care workers play a role in helping seniors maintain a healthy weight.

Physical Inactivity

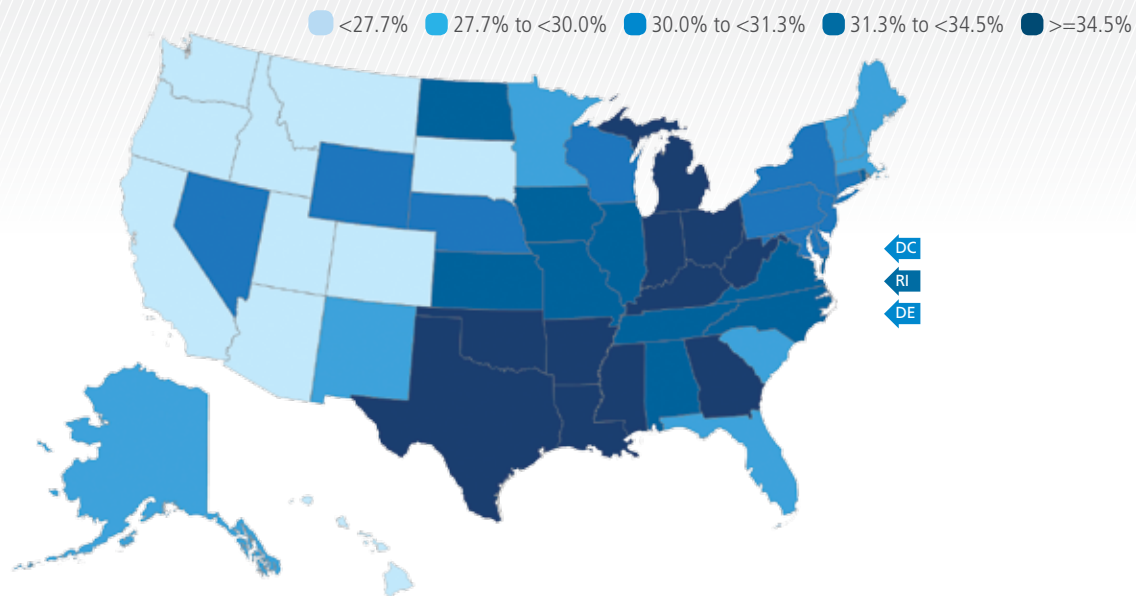

Physical inactivity increases the risk of cardiovascular disease, cancer, diabetes, hypertension, obesity, and premature death. Aging causes muscle mass and strength to decrease which challenges older adults who want to remain active. Increasing physical activity prevents and helps manage numerous chronic diseases. Physical activity has also been shown to increase bone density, reduce falls, prevent memory loss, and decrease depression. Growing evidence illustrates the importance of environment and community design to promote physical activity for seniors. Inadequate levels of physical activity in American adults is associated with an estimated \$117 billion in health care expenditures per year after adjusting for body mass index.

Dental Visits

Oral health naturally declines with age, and problems arise if routine care is not maintained. Poor oral health is associated with such chronic diseases as diabetes and cardiovascular disease, and can have a large impact on quality of life resulting in pain and affecting the ability to chew or speak. Gum disease affects nearly a quarter of adults aged 65 to 74 and more than 50,000 emergency department visits occur as a result of preventable dental conditions in adults aged 65 and older. Evidence indicates that older adults who use preventive dental care reduce

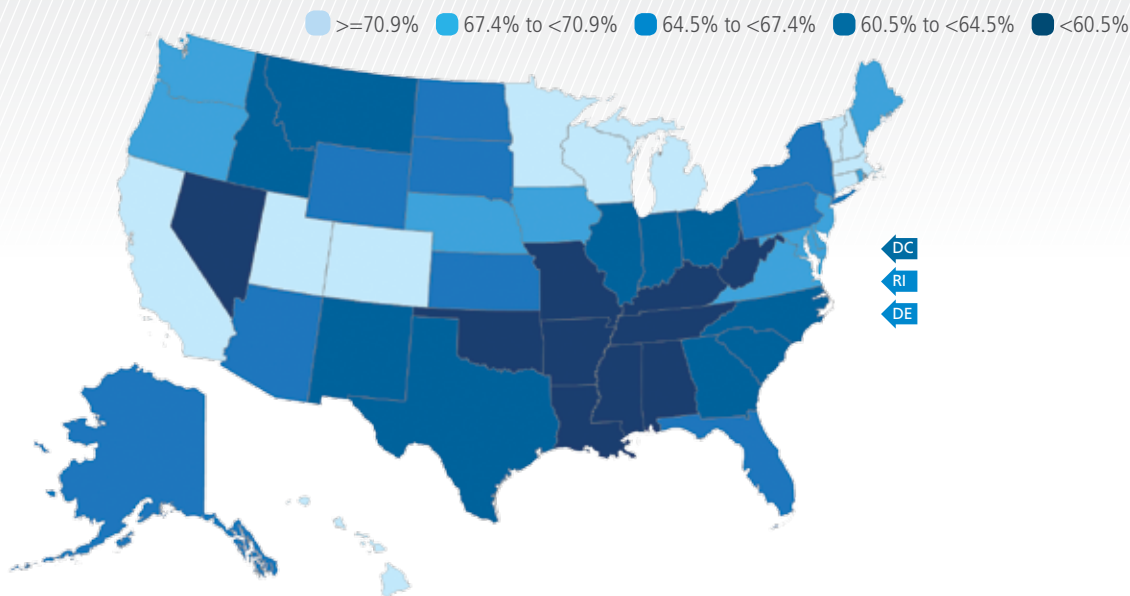

their dental bills and out-of-pocket payments because they have fewer visits for expensive non-preventive procedures.

Pain Management

Data source: Behavioral Risk Factor Surveillance System, 2013
 For details: www.americashealthrankings.org/ALL/pain_management_sr

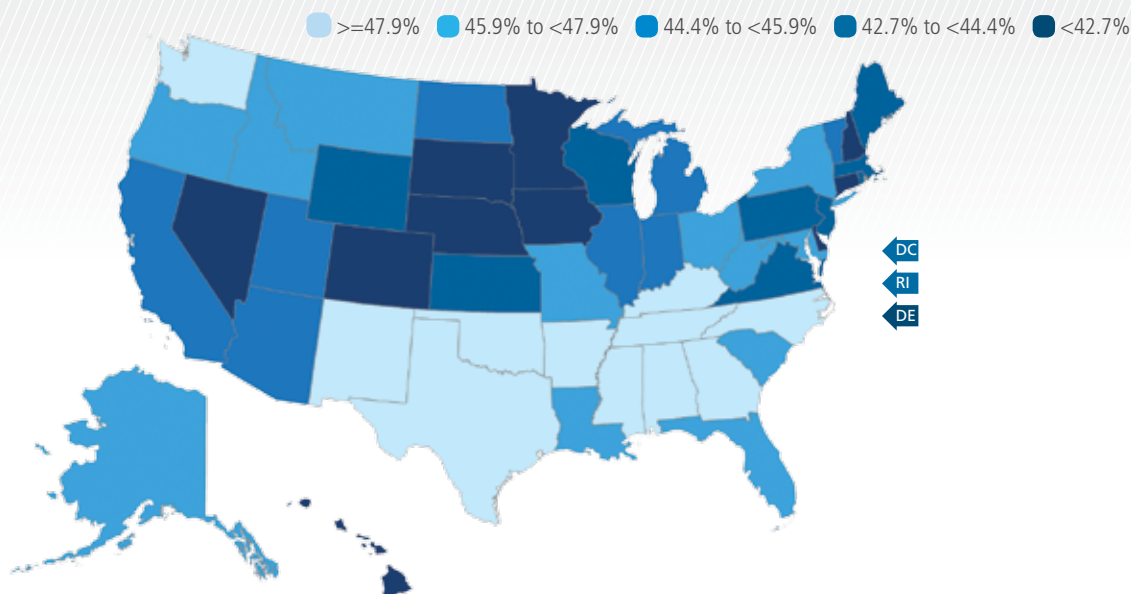

Osteoarthritis (OA), the most common form of arthritis, is a progressive degenerative joint disease more common in older, overweight individuals and those with a history of joint injury. It is associated with pain, aches, stiffness, and swelling. Many seniors believe that aches and pains are an inevitable part of aging, but risk factors can be prevented or modified to reduce pain caused by OA. Key factors that reduce risk include maintaining a healthy weight and regular physical activity, controlling blood sugar, and avoiding joint injuries. Physical activity

can reduce pain and improve function, mobility, mood, and quality of life for many adults with arthritis.

Prevalence by Income

Poverty

Including out-of-pocket medical expenses, about one in seven seniors lives in poverty. Poverty influences environmental exposures and health-related behaviors, and is associated with increased risk of mortality and chronic disease. Low-income seniors have a harder time paying for appropriate chronic disease management and preventive care, and often have low health literacy. Many seniors live on limited incomes, have modest savings, and struggle with rising costs of housing and health care as well as access to healthy food and reliable transportation. Among seniors, poverty rates increase with age, are higher for women than men, and for blacks and Hispanics versus whites.

Disparities in Poverty

Prevalence by Race/Ethnicity

Today, about 1 in 7 seniors live in poverty.

Volunteerism

Retirement provides increased free time that some seniors fill with volunteering. Volunteering provides a service for communities and organizations. It provides seniors with positive social interactions, a greater level of social support, and often a sense of purpose. Studies show that older adults who volunteer have better cognitive performance, fewer depressive symptoms, higher activity levels, and better mental health than seniors who do not volunteer. The health benefits of volunteering may extend

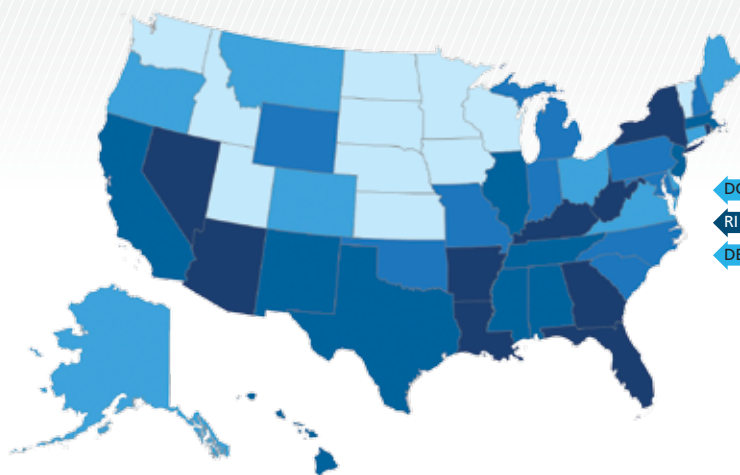

beyond psychological well-being; higher rates of volunteerism are associated with lower rates of mortality and heart disease, and a longer life span.

Nursing Home Quality

Data source: Centers for Medicare & Medicaid Services *Nursing Home Compare*, 2016
 For details: http://www.americashealthrankings.org/ALL/nursing_home_quality_sr

Poor quality care in nursing homes, including elder abuse and exploitation, has an enormous impact on the health and finances of US nursing home residents and taxpayers. Millions of dollars are spent yearly for medical treatments and hospitalizations related to falls, pressure ulcers, urinary incontinence, malnutrition, dehydration, and ambulatory care-sensitive diagnoses. Quality nursing home practices can largely prevent these negative health outcomes, and nursing homes nationwide are making efforts toward systematic quality improvement. The

Centers for Medicare & Medicaid Services amended the *Nursing Home Compare* rating scale in 2015, raising quality standards in nursing homes across the country.

Home-Delivered Meals

Access to healthy food is a struggle for some older adults and is of particular concern for seniors living at home. The Elderly Nutrition Program provides grant funding to states to administer home- and community-meal services. These programs target seniors at high risk for undernutrition and food insecurity due to illness, disability, isolation, or poverty. Home-delivered meal programs can enhance quality of life, provide a stable source of nutrition, increase nutrient intake, and help

older adults remain independent and in their homes despite functional limitations, resulting in a projected cost savings of \$109 million.

Food Insecurity

Data source: *The State of Senior Hunger in America 2013: An Annual Report*, April 2015
 For details: http://www.americashealthrankings.org/ALL/food_insecurity_sr

An estimated 9.6 million seniors faced the threat of hunger in 2013. Compared with younger adults, seniors living at home are at increased risk of hunger due to health conditions, poor food-management skills, limited mobility, lack of reliable social support, and poverty. Food-insecure seniors may have significantly reduced intakes of vital nutrients, which could have negative implications for overall health. There are numerous food assistance programs and community meal-delivery

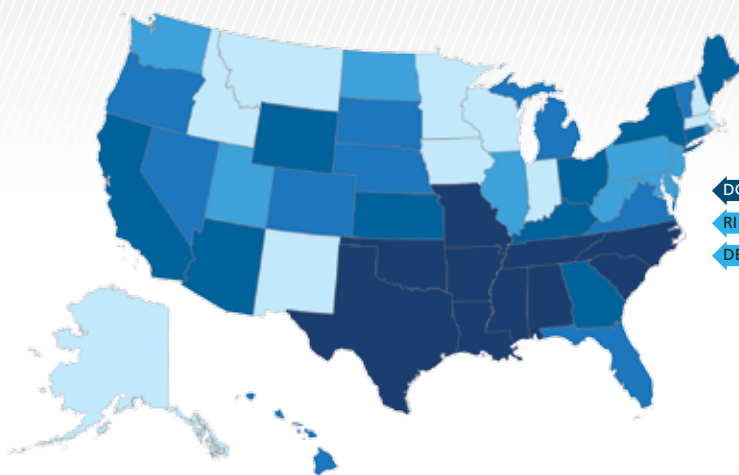

options that can help older adults maintain food security. Hunger among all Americans was estimated to cost the nation at least \$167.5 billion in 2010.

Community Support

States receive federal funding and allocate state resources to help older adults remain at home using home- and community-based services. Specifically, states may support senior programs that address services such as personal care, congregate meals, transportation, and health promotion. The Older Americans Act (OAA), governed by the Administration on Aging, has provided funding for home- and community-based services since 1965. Community public health spending varies substantially by state and is associated with reducing preventable mortality, especially

in low-resource communities. Increased OAA spending in a state is associated with fewer low-care nursing home residents.

Low-Care Nursing Home Residents

Low-care nursing home residents do not require the full suite of services provided by nursing homes and may be able to live in a less restrictive environment with the aid of community support. Community-based services, such as Meals on Wheels, visiting home health aides, transportation programs, and technology-delivered health care programs, may allow older adults to be cared for and remain in a less restrictive and more appropriate setting. Research suggests providing at-home meals to 1% more seniors in every state could

save more than \$100 million nationally by decreasing low-care prevalence. Beyond cost, aging in place has emotional, social, and health benefits.

SNAP Reach

The Supplemental Nutrition Assistance Program (SNAP) is the largest federal nutrition program, helping millions of low-income Americans access food and improve economic security. More than four million low-income households with adults aged 60 and older rely on SNAP to stretch their monthly food budget. On average, senior SNAP beneficiaries received \$129 per month in 2014 to help put food on the table. The Food and Nutrition Service works with states to promote SNAP; however, just 41% of eligible seniors enroll in the program, which may be due

to transportation and mobility issues, stigma, and misunderstanding about who is eligible, and how SNAP works.

Data source: Food and Nutrition Service, 2014

Prescription Drug Coverage

Data source: The Henry J Kaiser Family Foundation, *State Health Facts*, 2012
 For details: www.americashealthrankings.org/ALL/credible_drug_coverage_sr

Prescription drug coverage decreases financial strain and increases medication adherence. Medicare beneficiaries can obtain Medicare Part D, a voluntary Medicare drug benefit, through two types of private plans, a stand-alone prescription drug plan or a Medicare Advantage (Part C) plan that covers prescription drugs. Medicare Part D plans vary by state in cost and coverage.

Medicare beneficiaries in 2010 spent \$4,734 out-of-pocket for health care spending, on average, and 11% of that was spent on prescription drugs. Prescription drug coverage is associated with a 10% reduction in nonadherence due to cost.

Prescription Drug Coverage by State

Percentage of adults aged 65 and older who have a credible prescription drug plan

Geriatrician Shortfall

Geriatricians are vital to the health of seniors in outpatient and inpatient settings. Compared with standard hospital care, seniors receiving care in special geriatric units have better function at the time of discharge, and inpatient rehabilitative services involving geriatricians result in lower nursing home admissions and improved function at follow-up. In outpatient settings, geriatricians tend to provide better medication management than other clinicians. With aging baby boomers and increasing life expectancy, the number of needed geriatricians will continue to rise. Although the American

Geriatrics Society identifies a need to train an additional 1,500 geriatricians yearly, only 75 internal medicine or family medicine residents entered geriatrics fellowship programs in 2010.

Recommended Hospital Care

Receiving appropriate hospital care for heart attack, heart failure, pneumonia, and surgical procedures denotes high quality and generates cost savings. Hospitals with low complication rates tend to spend less per episode than those with high complication rates, indicating that foregoing proper care can be more costly. The conditions assessed in this measure are part of the Centers for Medicare & Medicaid Services quality initiative and were chosen for their validity and general acceptance as markers of quality. Despite making up only 14% of the population, seniors account for 35% of hospital stays.

Dedicated Health Care Provider

Older adults with a dedicated health care provider—compared with those without—are better positioned to receive care that can prevent, detect, and manage disease or other health conditions. Having a regular health care provider has been associated with improvements in preventive care and overall health status as well as improvements in chronic care management for asthma, hypertension, and diabetes. Individuals without a dedicated health care provider are more likely to visit the emergency department for non-urgent or avoidable problems. Seniors

face numerous obstacles in obtaining a dedicated health care provider including limited access, financial constraints, and a general lack of knowledge of the services and providers available.

Flu Vaccine

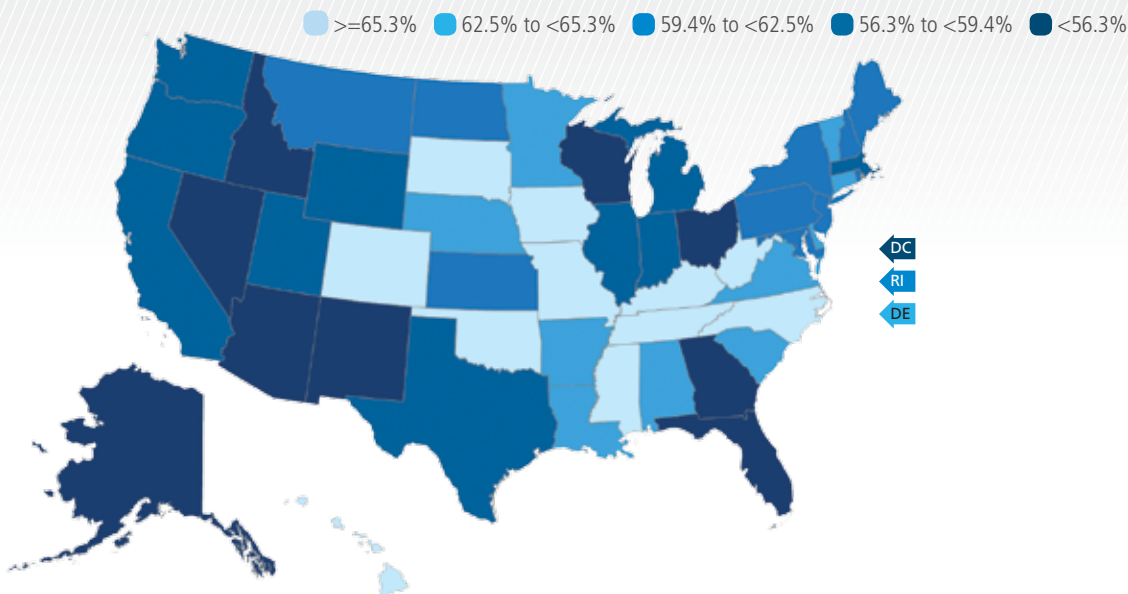

The flu vaccine helps protect individuals against seasonal influenza virus, a contagious respiratory infection that can lead to severe illness in older adults. Seniors are encouraged to receive the vaccine because they are at increased risk of contracting the virus. Additionally, almost 90% of flu-related deaths and more than half of hospitalizations are among older adults. Two forms of the flu vaccine are available for seniors: a regular-dose shot and a high-dose shot that elicits a stronger immune response. Flu vaccination is a highly cost-effective intervention and significantly reduces the number of hospitalizations in older adults. Medicare covers the cost of a single flu vaccination per year.

Health Screenings

Health screenings detect disease early when treatment is easiest. The US Preventive Services Task Force recommends screening for breast and colon cancer up to ages 74 and 75 respectively. Colon cancer risk increases with age, and more than half of breast cancer deaths occur in women aged 65 and older. Adults with health insurance or a usual source of care were more likely to report having received recommended cancer screenings

than those without insurance or a usual source of care in 2013. Older adults are also recommended to have regular blood pressure, cholesterol, and diabetes screenings.

Diabetes Management

Diabetes is the seventh-leading cause of death in the United States and contributes to heart disease and stroke, the leading and fifth-leading causes of death respectively. It is the leading cause of kidney failure, non-traumatic lower limb amputations, and blindness in adults. Type 2 diabetes is a largely preventable condition that may be managed through lifestyle interventions and medications. The risk of diabetes increases with age; 25.9% of adults aged 65 and older have diagnosed or undiagnosed diabetes, compared

with 16.2% of adults aged 45 to 64. Almost 60% of health care expenditures attributable to diabetes are for seniors, which amounts to an average annual per person cost of \$11,825.

Home Health Care

Data source: Bureau of Labor Statistics, 2015
 For details: www.americashealthrankings.org/ALL/home_health_care_sr

Home health and personal care aides enable seniors to remain in their homes after aging-related functional losses make independence difficult. A range of assistance is available, from skilled nursing services to basic assistance with activities of daily living. In-home and community-based services are less expensive than institutional services. National annual spending on long-term care services was estimated to be over \$147 billion in 2009 with over 77% for nursing home care and only 23% for non-institutional

services delivered in a person's home. Providing more home-based services may reduce spending growth in the long-term care sector.

Preventable Hospitalizations

Preventable hospitalizations is an indicator of primary care quality. Seeking routine care in outpatient settings for non-emergent acute or chronic conditions could prevent complications, more severe disease, and the need for hospitalization. Discharges for ambulatory care-sensitive services are highly correlated with general admissions, reflecting general overuse of the hospital as a site for care. Hospital care makes up the largest component of national health spending, costing nearly \$972 billion in 2014, and the majority of preventable hospital stays are among adults aged 65 and older. Preventable hospitalizations impose a nonessential financial burden on health care systems and can be avoided with less costly interventions.

Hospital Readmissions

Data source: The Dartmouth Atlas of Health Care, 2013
 For details: www.americashealthrankings.org/ALL/hospital_readmissions_sr

Confusion about prescribed medications, miscommunication of important information, and improper follow-up care are among the many reasons patients are readmitted to the hospital. Some readmissions are unavoidable, but many are preventable and there are steps hospitals can take to reduce them. The Affordable Care Act established the Hospital Readmissions Reduction Program under which the Centers for Medicare & Medicaid Services is required to reduce payments to hospitals with excess readmissions. Hospital readmissions for Medicare patients

alone cost about \$26 billion annually; cases that may have been avoided with proper care cost \$17 billion.

Hospice Care

Hospice care is intended for terminally ill patients and emphasizes pain control and emotional support for patients and families. It can be provided in a health care facility or in a patient's home. In 2014, seniors accounted for 84% of hospice patients and 85% of hospice patients were covered by the Medicare hospice benefit. The number of individuals receiving this care as well as the number of Medicare-certified hospices has dramatically increased in the past decade. Medicare covers certified services for patients with a life expectancy of six months or less. Expenditures for this benefit have rapidly increased over the past two decades to \$13.8 billion in 2011.

Hospital Deaths

Despite a societal preference for death at home or in a free-standing hospice facility, many seniors die in a hospital. In many circumstances dying in a hospital is avoidable through alternatives such as in-home hospice care. Studies show that patients who lack caregivers are more likely to die in an institution than patients with caregivers. In the past decade, the percentage of chronically ill Medicare patients dying in hospitals has declined, though this trend varies substantially by geography. End-of-life care in a hospital carries a high economic burden.

ICU Use

Overusing the critical care system often goes against the wishes of dying patients and is costly. Research indicates many patients receive care they would not choose in their final days. While not correlated with better outcomes or longer life, intensive care unit (ICU) use is correlated with availability of ICU beds; this could indicate a supply-induced demand. Areas with higher ICU use are high-use areas in other aspects as well, including physician visits and hospitalizations. End-of-life care accounts for a fourth of all Medicare spending, which means that minimizing ICU use offers a chance for meaningful cost savings and better adherence to patient preferences.

Hip Fracture

More than 250,000 adults aged 65 and older are hospitalized each year for hip fractures. Besides hospitalization, hip fractures often lead to surgery and extensive rehabilitation. A hip fracture may signal the end of independence; one in four previously independent seniors remain in a long-term care facility one year after injury. Osteoporosis, physical inactivity, poor vision, certain medications, and general frailty contribute to falls and hip fractures. Common prevention interventions include nutrition supplements, medications, and exercise regimens to maintain mobility, balance, and strength. The estimated lifetime cost of a hip fracture is \$81,300, with approximately 44% of that associated with nursing-facility expenses.

Falls

Annually, more than 12 million adults aged 65 and older fall. One out of five falls causes serious damage such as head injury or broken bones including costly hip fractures that severely limit mobility for long periods of time. Falls and their resulting injuries may contribute to social isolation and even cause premature death. The risk of falls and injury increases with age, making falls particularly problematic for persons older than age 75. Medicare pays for 78% of fall-related medical expenses which totaled

approximately \$34 billion in 2013, with each fall costing an average of \$9,000 to \$13,000.

Health Status

Self-reported health status is an indicator of the population's self-perceived health and is an independent predictor of mortality. It is a subjective measure that is not limited to certain health conditions or outcomes. It has been validated as a useful indicator of health for a variety of populations and allows for useful comparisons across different populations. It is influenced by life experience, the health of loved ones, social support, and similar factors that affect overall well-being.

Able-bodied

Nearly 39% of adults aged 65 and older have one or more disabilities. Chronic diseases such as diabetes and congestive heart failure are often precursors to disability. Arthritis is the most common cause of disability in older adults, accounting for more than 20% of cases. Seniors with a disability are more likely to require hospitalization and long-term care than those without a disability, and medical care costs are three times higher for disabled than nondisabled seniors. While some disabilities are largely unavoidable, the extent to which they interfere

with a person's life can be mitigated through exercise, special equipment or aids, and community support programs.

Premature Death

Premature death is a mortality measure reflecting the rate of death for seniors under age 75 and how those deaths burden the population. According to 2013 mortality data, heart disease, cancer, chronic lower respiratory disease, cerebrovascular disease, and Alzheimer’s disease are the United States’ top five causes of death among adults aged 65 to 74. Many of these premature deaths are preventable through lifestyle changes.

Evidence-based smoking interventions can greatly decrease premature deaths attributable to cancer. Heart disease is tied to modifiable risk factors including obesity, diabetes, and physical inactivity. Intervention strategies that encourage healthy lifestyles and preventive care can be effective in decreasing premature death in seniors.

Teeth Extractions

Untreated dental caries and periodontal disease are the most common causes of teeth extractions, but other causes include trauma, crowding, and disease. Preventable risk factors include poor diet and tobacco use. Older adults without natural teeth are at increased risk of heart disease and stroke. Absence of natural teeth affects nutrition; dentures are less efficient for chewing than are natural teeth, so people using dentures may choose foods softer than fruits and vegetables. The percentage of older adults without natural teeth is decreasing, likely due to improved

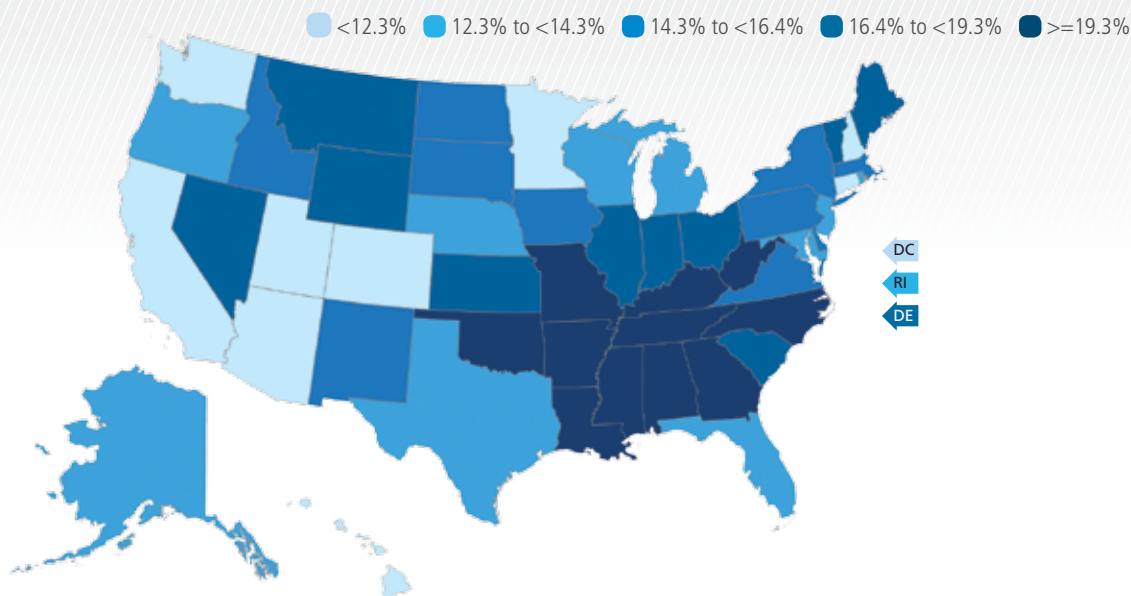

access to oral health care, public water-fluoridation programs, and reduced smoking rates.

Frequent Mental Distress

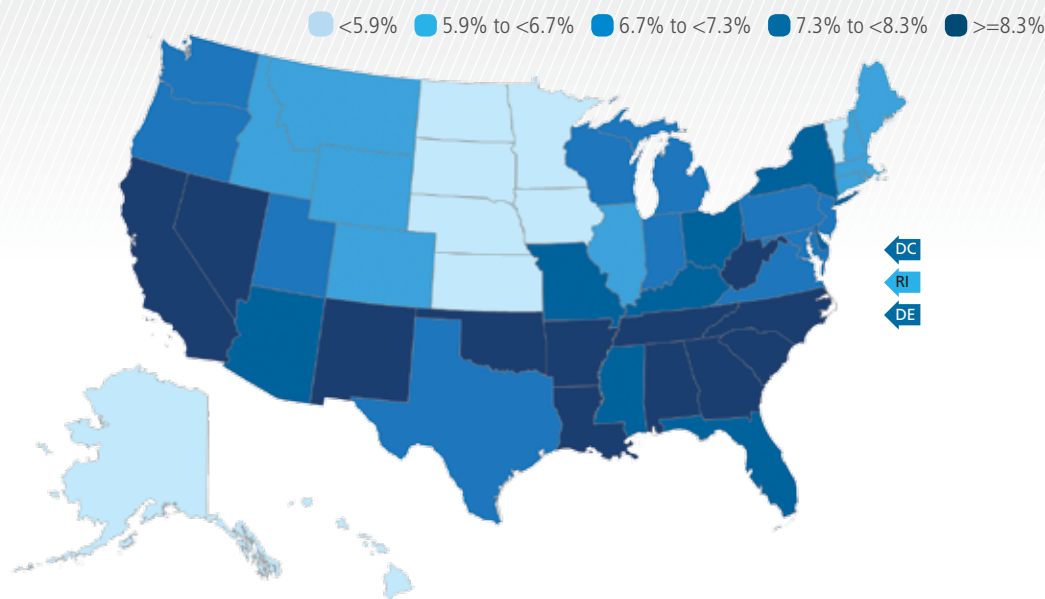

Frequent Mental Distress (FMD) emphasizes the burden of *chronic* and likely *severe* mental health issues and is an indicator of health-related quality of life, perceived mental distress, and the burden of mental illness on seniors. Older adults with FMD are more likely to have frequent insufficient sleep and are at increased risk of obesity. Depressive symptoms that contribute to frequent mental distress closely relate to impaired cognitive functioning and may reduce seniors' likelihood of utilizing treatment for their mental health issues. Chronic and severe mental health episodes are treatable and may be preventable through simple, cost-effective and time-efficient screening procedures, early interventions, and quality care.

Disparities in Frequent Mental Distress

Prevalence by Race/Ethnicity

Prevalence by Gender

Prevalence by Urbanicity

Prevalence by Education

Prevalence by Income

Supplemental Measures

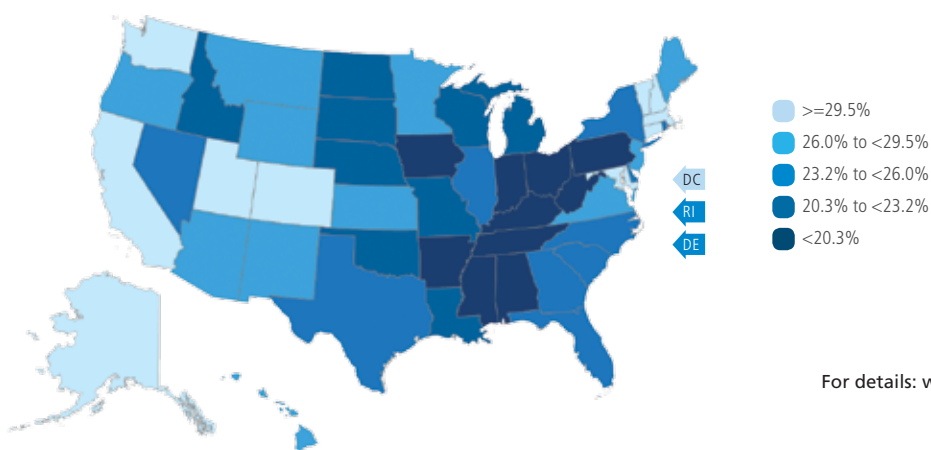

Education

Behaviors

Education fosters health; it enables people to learn about, create, and maintain a healthy lifestyle. Education is a strong predictor of life expectancy as well as overall well-being. Individuals with more education are more likely to have higher incomes, better health insurance coverage, and increased access to preventive health care. Increasing educational attainment

has been shown to improve the health status of the population as a whole; each additional year of education is associated with an increase in health-promoting behaviors and decreased mortality risk. Investments in early childhood education can positively influence long-term health and reduce health care expenditures.

Percentage of adults aged 65 and older with a college degree

Overuse — Mammography

Clinical Care

Mammography screening has been widely accepted as an important part of breast cancer detection and mortality reduction, but professional opinions are changing in light of evidence that benefits don't always outweigh the harms for women at average risk. Despite increased breast cancer risk with advancing age, the US Preventive Services Task Force does not recommend for or against mammography screening

in women aged 75 years and older. The predominant risk of mammography screening in women aged 75 and older is over diagnosis. For frail elderly women who have cognitive or functional impairments, over diagnosis and the resulting overtreatment can be especially burdensome, leading to psychological harms and costly follow-up.

Percentage of female Medicare beneficiaries aged 75 and older who had at least one screening mammogram

Data source: The Dartmouth Atlas of Healthcare, 2012

For details: www.americashealthrankings.org/ALL/mammography_sr

Overuse — PSA Test

Clinical Care

Age is the strongest risk factor for the development of prostate cancer. Men aged 75 years and older account for 70% of deaths due to prostate cancer. Randomized controlled trials of prostate cancer screening and treatment have not shown a significant reduction in prostate cancer mortality among men older than 70. No organizations currently endorse routine prostate cancer

screening for men at average risk due to concerns about the high rate of over diagnosis and potential for serious side effects associated with treatment. The US Preventive Services Task Force recommends against prostate-specific antigen (PSA) screening in all age groups stating the benefits do not outweigh the harms to men in the general US population.

Percentage of male Medicare beneficiaries aged 75 and older who received a screening PSA test

Data source: The Dartmouth Atlas of Healthcare, 2012
For details: www.americashealthrankings.org/ALL/PSA_test_sr

Multiple Chronic Conditions

Clinical Care

Chronic conditions negatively impact daily functioning and contribute to increased mortality risk. The prevalence of multiple chronic conditions (MCC) among older adults is much higher than the prevalence in the general population. Adults aged 65 and older with three or more chronic conditions, when compared with those with none, spend an additional

\$35,000 on medical care over a lifetime and their lives are 5.3 years shorter on average. Many common chronic conditions are largely preventable. Tobacco use, poor diet, insufficient exercise, and alcohol consumption are modifiable behaviors that contribute significantly to multiple chronic conditions.

Percentage of Medicare beneficiaries aged 65 and older with 4 or more chronic conditions

Data source: Centers for Medicare & Medicaid Services, 2014
For details: www.americashealthrankings.org/ALL/multiple_chronic_conditions_sr

Cognition

Clinical Care

More than 16 million US individuals have cognitive impairment (CI). Mild CI, marked by memory decline, affects nearly 25% of seniors living at home. Alzheimer’s disease, a severe form of CI, affects nearly 5.1 million adults nationwide. Age is the greatest risk factor for CI, and with the growing baby boomer population, demand is soaring for support services related to

cognitive issues. Cognitive impairment carries a large cost as individuals with CI have three times as many hospitalizations as those without. Evidence suggests that keeping intellectually engaged and physically active promote healthy cognitive aging.

Percentage of adults aged 65 and older who report having a cognitive difficulty

Data source: American Community Survey, 2014

For details: www.americashealthrankings.org/ALL/cognition_sr

Depression

Clinical Care

Depression affects an individual’s quality of life and can impair physical, mental, and social functioning. Risk factors include lack of social support, chronic disease, pain, and loss of a loved one. Estimates of the prevalence of depression among seniors vary widely, with higher rates found among those living in long-term care facilities. Seniors with even mild to moderate depression

are less likely to seek mental health care and often experience poorer health outcomes than their nondepressed peers. Compared with those who seek treatment, these individuals may use more medications, incur higher outpatient charges, and stay longer in the hospital.

Percentage of adults aged 65 and older who were told by a health professional that they have a depressive disorder

Data source: Behavioral Risk Factor Surveillance System, 2014

For details: www.americashealthrankings.org/ALL/depression_sr

Suicide

Clinical Care

Suicide is the 10th-leading cause of death in the United States. Risk factors in older adults include psychiatric illness, substance abuse, physical illness and disability, cognitive decline, and social isolation. In 2014 the general-population suicide rate was 13.4 deaths per 100,000. That same year, the rate was 15.7 deaths

per 100,000 adults aged 65 to 74; 17.7 deaths per 100,000 adults aged 75 to 84; and 19.3 deaths per 100,000 adults aged 85 and older. In 2010, suicide among those 65 and older had an estimated lifetime cost of \$1.1 billion.

Number of deaths due to intentional self-harm per 100,000 adults aged 65 and older

State Summaries

Alabama

Overall Rank: 44

Change: ▼ 2
 Determinants Rank: 40
 Outcomes Rank: 49

Strengths:

- Low prevalence of excessive drinking
- High percentage of seniors with dedicated provider
- High prescription drug coverage

Challenges:

- Low health status
- High prevalence of frequent mental distress
- Limited availability of home health care workers

Highlights:

- In the past year, SNAP reach decreased 26% from 69.8% to 51.9% of adults aged 65+ in poverty.
- In the past year, poverty increased 6% from 10.6% to 11.2% of adults aged 65+.
- In the past 2 years, hip fractures decreased 16% from 8.8 to 7.4 hospitalizations per 1,000 Medicare beneficiaries.
- In the past 3 years, home health care increased 12% from 47.2 to 53.0 home health care workers per 1,000 adults aged 75+.
- In the past 3 years, premature death decreased 4% from 2,403 to 2,307 deaths per 100,000 adults aged 65 to 74.

Ranking:

Alabama ranks 44th in *America's Health Rankings® Senior Report*; it was 42nd last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 46th.

Arkansas

ARKANSAS

Overall Rank: 47

Change: no change
 Determinants Rank: 47
 Outcomes Rank: 47

Strengths:

- Low prevalence of activity-limiting joint pain
- High percentage of quality nursing home beds
- Low prevalence of excessive drinking

Challenges:

- High prevalence of food insecurity
- High prevalence of physical inactivity
- High prevalence of falls

Highlights:

- In the past year, obesity increased 11% from 26.4% to 29.2% of adults aged 65+.
- In the past year, nursing home quality increased 12% from 44.7% to 50.1% of beds rated 4- or 5-stars.
- In the past year, flu vaccination coverage increased 9% from 58.0% to 63.5% of adults aged 65+.
- In the past 2 years, ICU use in last 6 months of life decreased 20% from 11.9% to 9.5% of decedents aged 65+.
- In the past 3 years, preventable hospitalizations decreased 17% from 79.3 to 65.9 discharges per 1,000 Medicare beneficiaries.

Ranking:

Arkansas ranks 47th in *America's Health Rankings® Senior Report*; it was 47th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 48th.

California

Overall Rank: 28

Change: ▲ 1
 Determinants Rank: 30
 Outcomes Rank: 28

Strengths:

- Low prevalence of obesity
- Low hip fracture rate
- High prescription drug coverage

Challenges:

- Low SNAP enrollment
- High prevalence of frequent mental distress
- High percentage of hospital deaths

Highlights:

- In the past year, home health care increased 11% from 65.1 to 72.4 home health care workers per 1,000 adults aged 75+.
- In the past year, nursing home quality increased 7% from 46.7% to 50.1% of beds rated 4- or 5-stars.
- In the past 2 years, smoking increased 36% from 5.9% to 8.0% of adults aged 65+.
- In the past 2 years, obesity increased 14% from 21.1% to 24.1% of adults aged 65+.
- In the past 3 years, hospice care increased 41% from 32.4% to 45.6% of decedents aged 65+.

Ranking:

California ranks 28th in *America's Health Rankings® Senior Report*; it was 29th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 16th.

Colorado

COLORADO

Overall Rank: 7

Change: ▲ 1
 Determinants Rank: 6
 Outcomes Rank: 4

Strengths:

- Low prevalence of physical inactivity
- Low rate of preventable hospitalizations
- High health status

Challenges:

- Low percentage of diabetes management
- High percentage of low-care nursing home residents
- Low percentage of health screenings

Highlights:

- In the past year, SNAP reach decreased 25% from 72.3% to 54.4% of adults aged 65+ in poverty.
- In the past year, full-mouth teeth extractions decreased 16% from 12.4% to 10.4% of adults aged 65+.
- In the past 2 years, preventable hospitalizations decreased 24% from 43.7 to 33.2 discharges per 1,000 Medicare beneficiaries.
- In the past 3 years, food insecurity increased 27% from 11.5% to 14.6% of adults aged 60+.
- In the past 3 years, very good or excellent health status increased 12% from 44.9% to 50.2% of adults aged 65+.

Ranking:

Colorado ranks 7th in *America's Health Rankings® Senior Report*; it was 8th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 8th.

Strengths:

- High percentage of dental visits
- Low geriatrician shortfall
- High percentage of able-bodied seniors

Challenges:

- High percentage of hospital deaths
- High prevalence of activity-limiting joint pain
- Limited availability of home-delivered meals

Highlights:

- In the past year, nursing home quality increased 11% from 46.2% to 51.2% of beds rated 4- or 5-stars.
- In the past year, preventable hospitalizations decreased 12% from 56.7 to 50.1 discharges per 1,000 Medicare beneficiaries.
- In the past year, low-care nursing home residents decreased 11% from 15.1% to 13.5% of residents.
- In the past 2 years, poverty increased 16% from 6.7% to 7.8% of adults aged 65+.
- In the past 3 years, hospital deaths decreased 24% from 32.2% to 24.6% of decedents aged 65+.

DELAWARE

Overall Rank: 22

Change: ▼ 4
 Determinants Rank: 24
 Outcomes Rank: 23

Strengths:

- High percentage of health screenings
- High percentage of able-bodied seniors
- High hospice care use

Challenges:

- High prevalence of obesity
- High percentage of low-care nursing home residents
- High prevalence of frequent mental distress

Highlights:

- In the past year, home health care increased 32% from 63.3 to 83.5 home health care workers per 1,000 adults aged 75+.
- In the past year, smoking increased 25% from 8.4% to 10.5% of adults aged 65+.
- In the past year, nursing home quality decreased 19% from 57.6% to 46.6% of beds rated 4- or 5-stars.
- In the past 2 years, food insecurity increased 25% from 10.1% to 12.6% of adults aged 60+.
- In the past 3 years, hospital deaths decreased 39% from 29.1% to 17.8% of decedents aged 65+.

Ranking:

Delaware ranks 22nd in *America's Health Rankings® Senior Report*; it was 18th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 32nd.

Overall Rank: 24

Change: ▲ 3
 Determinants Rank: 20
 Outcomes Rank: 27

Strengths:

- High percentage of diabetes management
- Low prevalence of obesity
- Low prevalence of falls

Challenges:

- High prevalence of excessive drinking
- Limited availability of home health care workers
- Low flu vaccination coverage

Highlights:

- In the past year, SNAP reach decreased 14% from 92.2% to 79.4% of adults aged 65+ in poverty.
- In the past year, full-mouth teeth extractions decreased 18% from 15.8% to 13.0% of adults aged 65+.
- In the past year, smoking decreased 15% from 8.7% to 7.4% of adults aged 65+.
- In the past 3 years, flu vaccination coverage decreased 8% from 57.6% to 52.8% of adults aged 65+.
- In the past 3 years, hospice care use increased 24% from 49.5% to 61.4% of decedents aged 65+.

Ranking:

Florida ranks 24th in *America's Health Rankings® Senior Report*; it was 27th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 33rd.

Georgia

GEORGIA

Overall Rank: 39

Change: no change
 Determinants Rank: 37
 Outcomes Rank: 41

Strengths:

- Low prevalence of excessive drinking
- High hospice care use
- High percentage of health screenings

Challenges:

- Low flu vaccination coverage
- High hip fracture rate
- Low percentage of quality nursing home beds

Highlights:

- In the past year, SNAP reach decreased 21% from 87.7% to 69.3% of adults aged 65+ in poverty.
- In the past year, nursing home quality increased 22% from 28.4% to 34.6% of beds rated 4- or 5-stars.
- In the past 2 years, preventable hospitalizations decreased 15% from 65.2 to 55.1 discharges per 1,000 Medicare beneficiaries.
- In the past 3 years, smoking decreased 25% from 10.8% to 8.1% of adults aged 65+.
- In the past 3 years, very good or excellent health status increased 16% from 32.9% to 38.1% of adults aged 65+.

Ranking:

Georgia ranks 39th in *America's Health Rankings® Senior Report*; it was 39th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 40th.

Illinois

Overall Rank: 36

Change: ▲ 1
 Determinants Rank: 42
 Outcomes Rank: 31

Strengths:

- High SNAP enrollment
- Low prevalence of frequent mental distress
- High percentage of seniors with dedicated provider

Challenges:

- High prevalence of obesity
- High ICU use in last 6 months of life
- High percentage of low-care nursing home residents

Highlights:

- In the past year, smoking increased 23% from 8.6% to 10.6% of adults aged 65+.
- In the past year, obesity increased 8% from 28.8% to 31.0% of adults aged 65+.
- In the past year, preventable hospitalizations decreased 9% from 65.2 to 59.4 discharges per 1,000 Medicare beneficiaries.
- In the past 3 years, low-care nursing home residents decreased 33% from 26.7% to 18.0% of residents.
- In the past 3 years, home health care increased 33% from 77.7 to 103.4 home health care workers per 1,000 adults aged 75+.

Ranking:

Illinois ranks 36th in *America's Health Rankings® Senior Report*; it was 37th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 28th.

Indiana

INDIANA

Overall Rank: 37

Change: ▲ 3
 Determinants Rank: 33
 Outcomes Rank: 39

Strengths:

- Low prevalence of excessive drinking
- Low percentage of seniors living in poverty
- Low percentage of low-care nursing home residents

Challenges:

- High prevalence of physical inactivity
- Low percentage of health screenings
- High prevalence of falls

Highlights:

- In the past year, nursing home quality increased 11% from 44.8% to 49.8% of beds rated 4- or 5-stars.
- In the past year, home-delivered meals decreased 16% from 15.9% to 13.3% of seniors in poverty.
- In the past 3 years, obesity increased 14% from 26.6% to 30.2% of adults aged 65+.
- In the past 3 years, home health care increased 24% from 80.2 to 99.3 home health care workers per 1,000 adults aged 75+.
- In the past 3 years, hospice care use increased 39% from 35.2% to 49.0% of decedents aged 65+.

Ranking:

Indiana ranks 37th in *America's Health Rankings® Senior Report*; it was 40th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 41st.

Projected Increase 2016 to 2030	44.0	49.5

Overall Rank: 45

Change: ▲ 3
 Determinants Rank: 44
 Outcomes Rank: 50

Strengths:

- Low prevalence of excessive drinking
- Low percentage of low-care nursing home residents
- High flu vaccination coverage

Challenges:

- High prevalence of physical inactivity
- High rate of preventable hospitalizations
- High prevalence of full-mouth teeth extractions

Highlights:

- In the past year, SNAP reach decreased 13% from 66.4% to 58.1% of adults aged 65+ in poverty.
- In the past year, dental visit increased 8% from 53.0% to 57.0% of adults aged 65+.
- In the past 2 years, flu vaccination coverage increased 11% from 61.8% to 68.9% of adults aged 65+.
- In the past 3 years, hip fractures decreased 17% from 8.8 to 7.3 hospitalizations per 1,000 Medicare beneficiaries.
- In the past 3 years, home health care increased 54% from 36.6 to 56.5 home health care workers per 1,000 adults aged 75+.

Ranking:

Kentucky ranks 45th in *America's Health Rankings® Senior Report*; it was 48th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 44th.

State Health Department Website:

Louisiana

LOUISIANA

Overall Rank: 50

Change: no change
 Determinants Rank: 50
 Outcomes Rank: 43

Strengths:

- High flu vaccination coverage
- Low prevalence of falls
- Ready availability of home health care workers

Challenges:

- High percentage of hospital readmissions
- High prevalence of obesity
- Low percentage of quality nursing home beds

Highlights:

- In the past year, dental visit increased 12% from 51.0% to 57.2% of adults aged 65+.
- In the past year, SNAP reach decreased 18% from 62.1% to 50.7% of adults aged 65+ in poverty.
- In the past year, full-mouth teeth extractions decreased 29% from 28.7% to 20.5% of adults aged 65+.
- In the past 3 years, low-care nursing home residents decreased 28% from 22.8% to 16.5% of residents.
- In the past 3 years, preventable hospitalizations decreased 20% from 92.1 to 73.3 discharges per 1,000 Medicare beneficiaries.

Ranking:

Louisiana ranks 50th in *America's Health Rankings® Senior Report*; it was 50th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 50th.

Projected Increase 2016 to 2030	43.2	49.5

Overall Rank: 1

Change: ▲ 5
 Determinants Rank: 1
 Outcomes Rank: 6

Strengths:

- High health status
- High percentage of diabetes management
- Low hip fracture rate

Challenges:

- High prevalence of excessive drinking
- Low volunteerism
- High percentage of hospital deaths

Highlights:

- In the past year, smoking decreased 20% from 9.6% to 7.7% of adults aged 65+.
- In the past year, physical inactivity decreased 12% from 33.1% to 29.1% of adults aged 65+ in fair or better health.
- In the past year, flu vaccination coverage decreased 13% from 66.1% to 57.8% of adults aged 65+.
- In the past 2 years, hip fractures decreased 23% from 6.5 to 5.0 hospitalizations per 1,000 Medicare beneficiaries.
- In the past 3 years, home health care increased 42% from 84.7 to 120.6 home health care workers per 1,000 adults aged 75+.

Ranking:

Massachusetts ranks 1st in *America's Health Rankings® Senior Report*; it was 6th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 3rd.

Michigan

MICHIGAN

Overall Rank: 26

Change: ▼ 9
 Determinants Rank: 18
 Outcomes Rank: 33

Strengths:

- High percentage of dental visits
- Ready availability of home-delivered meals
- High percentage of seniors with dedicated provider

Challenges:

- High prevalence of obesity
- High percentage of hospital readmissions
- High prevalence of falls

Highlights:

- In the past year, physical inactivity increased 12% from 30.8% to 34.5% of adults aged 65+ in fair or better health.
- In the past year, food insecurity increased 26% from 12.1% to 15.3% of adults aged 60+.
- In the past 2 years, community support decreased 47% from \$1213 to \$638 per adult aged 65+ in poverty.
- In the past 2 years, preventable hospitalizations decreased 16% from 70.3 to 59.1 discharges per 1,000 Medicare beneficiaries.
- In the past 2 years, falls increased 101% from 16.2% to 32.6% of adults aged 65+.

Ranking:

Michigan ranks 26th in *America's Health Rankings® Senior Report*; it was 17th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 35th.

Overall Rank: 20

Change: ▼ 4
 Determinants Rank: 26
 Outcomes Rank: 15

Strengths:

- High volunteerism
- High prescription drug coverage
- Low prevalence of frequent mental distress

Challenges:

- Low SNAP enrollment
- Limited availability of home health care workers
- Low percentage of diabetes management

Highlights:

- In the past year, SNAP reach decreased 21% from 54.4% to 42.8% of adults aged 65+ in poverty.
- In the past year, nursing home quality decreased 7% from 48.3% to 44.8% of beds rated 4- or 5-stars.
- In the past 3 years, food insecurity increased 99% from 7.7% to 15.3% of adults aged 60+.
- In the past 3 years, very good or excellent health status increased 13% from 40.2% to 45.5% of adults aged 65+.
- In the past 3 years, preventable hospitalizations decreased 22% from 65.4 to 51.3 discharges per 1,000 Medicare beneficiaries.

Ranking:

Nebraska ranks 20th in *America's Health Rankings® Senior Report*; it was 16th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 10th.

State Health Department Website:

www.dhhs.ne.gov/

Nevada

NEVADA

Overall Rank: 42

Change: ▲ 1
 Determinants Rank: 46
 Outcomes Rank: 34

Strengths:

- Low prevalence of falls
- Low rate of preventable hospitalizations
- Low percentage of low-care nursing home residents

Challenges:

- High prevalence of excessive drinking
- Low community support expenditures
- Low flu vaccination coverage

Highlights:

- In the past year, very good or excellent health status decreased 13% from 46.0% to 39.9% of adults aged 65+.
- In the past year, smoking decreased 18% from 15.4% to 12.6% of adults aged 65+.
- In the past year, obesity increased 15% from 23.9% to 27.6% of adults aged 65+.
- In the past 2 years, community support increased 18% from \$283 to \$335 per adult aged 65+ in poverty.
- In the past 3 years, preventable hospitalizations decreased 21% from 58.1 to 45.7 discharges per 1,000 Medicare beneficiaries.

Ranking:

Nevada ranks 42nd in *America's Health Rankings® Senior Report*; it was 43rd last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 38th.

Overall Rank: 33

Change: no change
 Determinants Rank: 29
 Outcomes Rank: 35

Strengths:

- Low prevalence of obesity
- Low prevalence of food insecurity
- Ready availability of home health care workers

Challenges:

- Low percentage of seniors with dedicated provider
- High percentage of seniors in poverty
- High prevalence of frequent mental distress

Highlights:

- In the past year, physical inactivity increased 15% from 25.6% to 29.4% of adults aged 65+ in fair or better health.
- In the past year, falls decreased 13% from 32.0% to 27.8% of adults aged 65+.
- In the past 2 years, hip fractures decreased 14% from 8.0 to 6.9 hospitalizations per 1,000 Medicare beneficiaries.
- In the past 3 years, food insecurity decreased 55% from 21.2% to 9.5% of adults aged 60+.
- In the past 3 years, preventable hospitalizations decreased 17% from 54.9 to 45.5 discharges per 1,000 Medicare beneficiaries.

Ranking:

New Mexico ranks 33rd in *America's Health Rankings® Senior Report*; it was 33rd last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 37th.

New York

NEW YORK

Overall Rank: 23

Change: ▼ 2
 Determinants Rank: 25
 Outcomes Rank: 21

Strengths:

- High prescription drug coverage
- High SNAP enrollment
- Ready availability of home health care workers

Challenges:

- High percentage of seniors in poverty
- Low hospice care use
- High percentage of hospital deaths

Highlights:

- In the past year, preventable hospitalizations decreased 10% from 59.2 to 53.3 discharges per 1,000 Medicare beneficiaries.
- In the past year, very good or excellent health status increased 10% from 37.8% to 41.4% of adults aged 65+.
- In the past 2 years, food insecurity increased 10% from 14.8% to 16.3% of adults aged 60+.
- In the past 2 years, home health care increased 23% from 196.9 to 242.1 home health care workers per 1,000 adults aged 75+.
- In the past 3 years, hospital deaths decreased 21% from 39.0% to 30.9% of decedents aged 65+.

Ranking:

New York ranks 23rd in *America's Health Rankings® Senior Report*; it was 21st last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 13th.

Overall Rank: 38

Change: ▼ 8
 Determinants Rank: 36
 Outcomes Rank: 36

Strengths:

- High prescription drug coverage
- High hospice care use
- Low percentage of hospital deaths

Challenges:

- High prevalence of obesity
- High prevalence of physical inactivity
- Low flu vaccination coverage

Highlights:

- In the past year, food insecurity increased 26% from 12.9% to 16.3% of adults aged 60+.
- In the past year, obesity increased 17% from 28.6% to 33.4% of adults aged 65+.
- In the past year, flu vaccination coverage decreased 11% from 62.6% to 55.7% of adults aged 65+.
- In the past 2 years, preventable hospitalizations decreased 17% from 78.5 to 64.9 discharges per 1,000 Medicare beneficiaries.
- In the past 3 years, hip fractures decreased 14% from 7.2 to 6.2 hospitalizations per 1,000 Medicare beneficiaries.

Ranking:

Ohio ranks 38th in *America's Health Rankings® Senior Report*; it was 30th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 39th.

Oklahoma

OKLAHOMA

Overall Rank: 49

Change: ▼ 3
 Determinants Rank: 48
 Outcomes Rank: 46

Strengths:

- Low prevalence of excessive drinking
- Low prevalence of activity-limiting joint pain
- High flu vaccination coverage

Challenges:

- High prevalence of physical inactivity
- Low percentage of health screenings
- High hip fracture rate

Highlights:

- In the past year, smoking increased 13% from 9.9% to 11.2% of adults aged 65+.
- In the past year, food insecurity increased 11% from 15.4% to 17.1% of adults aged 60+.
- In the past year, full-mouth teeth extractions increased 7% from 21.0% to 22.4% of adults aged 65+.
- In the past 3 years, volunteerism increased 10% from 22.0% to 24.3% of adults aged 65+.
- In the past 3 years, hospice care use increased 24% from 44.4% to 55.1% of decedents aged 65+.

Ranking:

Oklahoma ranks 49th in *America's Health Rankings® Senior Report*; it was 46th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 45th.

- High SNAP enrollment

Challenges:

- Limited availability of home-delivered meals
- Low volunteerism
- Low community support expenditures

Highlights:

- In the past year, food insecurity decreased 22% from 16.2% to 12.6% of adults aged 60+.
- In the past year, low-care nursing home residents decreased 30% from 18.0% to 12.6% of residents.
- In the past year, hospital deaths decreased 11% from 21.2% to 18.8% of decedents aged 65+.
- In the past 2 years, ICU use in last 6 months of life decreased 28% from 11.3% to 8.1% of decedents aged 65+.
- In the past 3 years, obesity increased 18% from 22.2% to 26.1% of adults aged 65+.

Ranking:

Rhode Island ranks 11th in *America's Health Rankings® Senior Report*; it was 14th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 14th.

South Carolina

SOUTH CAROLINA

Overall Rank: 34

Change: ▲ 2
 Determinants Rank: 27
 Outcomes Rank: 40

Strengths:

- Low percentage of low-care nursing home residents
- High hospice care use
- High percentage of diabetes management

Challenges:

- High prevalence of food insecurity
- High prevalence of frequent mental distress
- Low percentage of dental visits

Highlights:

- In the past year, low-care nursing home residents decreased 9% from 5.7% to 5.2% of residents.
- In the past year, poverty decreased 9% from 10.2% to 9.3% of adults aged 65+.
- In the past 2 years, hip fractures decreased 20% from 8.3 to 6.6 hospitalizations per 1,000 Medicare beneficiaries.
- In the past 3 years, preventable hospitalizations decreased 19% from 61.2 to 49.8 discharges per 1,000 Medicare beneficiaries.
- In the past 3 years, hospice care use increased 64% from 35.6% to 58.3% of decedents aged 65+.

Ranking:

South Carolina ranks 34th in *America's Health Rankings® Senior Report*; it was 36th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 42nd.

Overall Rank: 25

Change: ▼ 2
 Determinants Rank: 28
 Outcomes Rank: 14

Strengths:

- High flu vaccination coverage
- Low percentage of hospital readmissions
- Low prevalence of frequent mental distress

Challenges:

- Low SNAP enrollment
- Low percentage of seniors with dedicated provider
- Low hospice care use

Highlights:

- In the past year, nursing home quality increased 19% from 36.4% to 43.3% of beds rated 4- or 5-stars.
- In the past year, full-mouth teeth extractions decreased 17% from 19.4% to 16.1% of adults aged 65+.
- In the past year, hospital readmissions decreased 11% from 14.2% to 12.6% of hospitalized patients aged 65+.
- In the past 3 years, physical inactivity decreased 26% from 35.9% to 26.6% of adults aged 65+ in fair or better health.
- In the past 3 years, food insecurity increased 26% from 11.1% to 14.0% of adults aged 60+.

Ranking:

South Dakota ranks 25th in *America's Health Rankings® Senior Report*; it was 23rd last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 19th.

Vermont

Overall Rank: 2

Change: ▼ 1
 Determinants Rank: 2
 Outcomes Rank: 8

Strengths:

- Low prevalence of smoking
- High SNAP enrollment
- High health status

Challenges:

- Low hospice care use
- High prevalence of excessive drinking
- High prevalence of falls

Highlights:

- In the past year, smoking decreased 22% from 7.4% to 5.8% of adults aged 65+.
- In the past year, food insecurity increased 24% from 12.3% to 15.3% of adults aged 60+.
- In the past 2 years, geriatrician shortfall increased 40% from 43.6% to 61.2% of needed geriatricians.
- In the past 2 years, hip fractures decreased 25% from 6.9 to 5.2 hospitalizations per 1,000 Medicare beneficiaries.
- In the past 3 years, hospice care use increased 46% from 23.5% to 34.4% of decedents aged 65+.

Ranking:

Vermont ranks 2nd in *America's Health Rankings® Senior Report*; it was 1st last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 2nd.

Virginia

VIRGINIA

Overall Rank: 29

Change: ▼ 1
 Determinants Rank: 31
 Outcomes Rank: 24

Strengths:

- Low prevalence of falls
- High percentage of dental visits
- High percentage of diabetes management

Challenges:

- Low percentage of quality nursing home beds
- Low prescription drug coverage
- High percentage of hospital deaths

Highlights:

- In the past year, SNAP reach decreased 28% from 69.0% to 49.4% of adults aged 65+ in poverty.
- In the past year, preventable hospitalizations decreased 11% from 55.2 to 49.0 discharges per 1,000 Medicare beneficiaries.
- In the past year, food insecurity increased 16% from 12.0% to 13.9% of adults aged 60+.
- In the past 2 years, hip fractures decreased 22% from 7.7 to 6.0 hospitalizations per 1,000 Medicare beneficiaries in the last 6 months of life.
- In the past 2 years, ICU use in last 6 months of life increased 17% from 13.8% to 16.1% of decedents aged 65+.

Ranking:

Virginia ranks 29th in *America's Health Rankings® Senior Report*; it was 28th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 21st.

Overall Rank: 10

Change: ▲ 1
 Determinants Rank: 10
 Outcomes Rank: 16

Strengths:

- Low prevalence of physical inactivity
- Low rate of preventable hospitalizations
- Low hip fracture rate

Challenges:

- High prevalence of falls
- High prevalence of excessive drinking
- Low prescription drug coverage

Highlights:

- In the past year, nursing home quality increased 14% from 47.4% to 53.8% of beds rated 4- or 5-stars.
- In the past year, food insecurity decreased 12% from 13.5% to 11.9% of adults aged 60+.
- In the past 2 years, low-care nursing home residents increased 31% from 6.4% to 8.4% of residents.
- In the past 3 years, hospice care use increased 39% from 33.4% to 46.4% of decedents aged 65+.
- In the past 3 years, very good or excellent health status increased 11% from 42.1% to 46.8% of adults aged 65+.

Ranking:

Washington ranks 10th in *America's Health Rankings® Senior Report*; it was 11th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 9th.

Overall Rank: 13

Change: ▼ 6
 Determinants Rank: 17
 Outcomes Rank: 7

Strengths:

- High percentage of health screenings
- High percentage of diabetes management
- Low prevalence of food insecurity

Challenges:

- High prevalence of excessive drinking
- Low flu vaccination coverage
- High prevalence of obesity

Highlights:

- In the past year, home-delivered meals decreased 14% from 30.7% to 26.4% of seniors in poverty.
- In the past year, community support decreased 27% from \$794 to \$579 per adult aged 65+ in poverty.
- In the past 2 years, home health care increased 29% from 127.3 to 164.5 home health care workers per 1,000 adults aged 75+.
- In the past 3 years, preventable hospitalizations decreased 13% from 55.3 to 47.9 discharges per 1,000 Medicare beneficiaries.
- In the past 3 years, smoking decreased 22% from 9.6% to 7.5% of adults aged 65+.

Ranking:

Wisconsin ranks 13th in *America's Health Rankings® Senior Report*; it was 7th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 24th.

State Health Department Website:

www.dhs.wisconsin.gov

Wyoming

WYOMING

Overall Rank: 35

Change: no change
 Determinants Rank: 41
 Outcomes Rank: 30

Strengths:

- Low prevalence of obesity
- High community support expenditures
- Low ICU use in last 6 months of life

Challenges:

- Low SNAP enrollment
- Low percentage of health screenings
- Low hospice care use

Highlights:

- In the past year, home-delivered meals decreased 24% from 108.1% to 82.1% of seniors in poverty.
- In the past year, nursing home quality decreased 27% from 45.9% to 33.4% of beds rated 4- or 5-stars.
- In the past 2 years, ICU use in last 6 months of life decreased 28% from 8.6% to 6.2% of decedents aged 65+.
- In the past 3 years, obesity increased 21% from 20.4% to 24.7% of adults aged 65+.
- In the past 3 years, hospice care use increased 58% from 21.9% to 34.7% of decedents aged 65+.

Ranking:

Wyoming ranks 35th in *America's Health Rankings® Senior Report*; it was 35th last year. In the 2015 *America's Health Rankings®* (all ages), the state ranks 25th.

Overall Rank: Not ranked

Strengths:

- Low prevalence of obesity
- High percentage of quality nursing home beds
- High SNAP enrollment

Challenges:

- High prevalence of food insecurity
- High percentage of seniors in poverty
- Low prescription drug coverage

Highlights:

- In the past year, food insecurity increased 34% from 15.2% to 20.3% of adults aged 60+.
- In the past year, home health care increased 33% from 226.0 to 301.7 home health care workers per 1,000 adults aged 75+.
- In the past year, falls increased 9% from 27.5% to 30.1% of adults aged 65+.
- In the past 3 years, volunteerism increased 24% from 22.7% to 28.1% of adults aged 65+.
- In the past 3 years, hospice care use increased 61% from 27.2% to 43.9% of decedents aged 65+.

State Health Department Website: doh.dc.gov

United States

Highlights:

- In the past year, community support decreased 7% from \$873 to \$811 per adult aged 65+ in poverty.
- In the past year, home-delivered meals decreased 7% from 20.6% to 19.1% of seniors in poverty.
- In the past year, food insecurity increased 5% from 14.8% to 15.5% of adults aged 60+.
- In the past year, SNAP reach decreased 10% from 75.2% to 67.4% of adults aged 65+ in poverty.
- In the past year, preventable hospitalizations decreased 9% from 59.3 to 53.8 discharges per 1,000 Medicare beneficiaries.
- In the past 3 years, obesity increased 9% from 25.3% to 27.5% of adults aged 65+.
- In the past 3 years, hospice care use increased 40% from 36.7% to 51.4% of decedents aged 65+.
- In the past 3 years, hip fractures decreased 19% from 7.3 to 5.9 hospitalizations per 1,000 Medicare beneficiaries.

TABLE 8

Description of Core Measures

Measure	Description	Source, Data Year(s)	
Behaviors	Smoking	Percentage of adults aged 65 and older who are self-reported smokers (smoked at least 100 cigarettes in their lifetime and currently smoke every day or some days)	Centers for Disease Control and Prevention (CDC). <i>Behavioral Risk Factor Surveillance System</i> , 2014
	Excessive Drinking	Percentage of adults aged 65 and older who self-report either binge drinking (having five or more [men] or four or more [women] drinks on one occasion in the last month) or chronic drinking (having more than two drinks [men] or more than one drink [women] per day)	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
	Obesity	Percentage of adults aged 65 and older estimated to be obese (body mass index [BMI] of 30.0 or higher) based on self-reported height and weight	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
	Underweight	Percentage of adults aged 65 and older with fair or better health status estimated to be underweight (BMI of 18.5 or less) based on self-reported height and weight	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
	Physical Inactivity	Percentage of adults aged 65 and older with fair or better health status who self-report doing no physical activity or exercise other than their regular job in the last 30 days	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
	Dental Visit	Percentage of adults aged 65 and older who self-report visiting the dentist or dental clinic within the past year for any reason	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
	Pain Management*	Percentage of adults aged 65 and older with arthritis who self-report arthritis or joint pain does not limit their usual activities	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2013
Community & Environment Macro	Poverty**	Percentage of adults aged 65 and older who live in households at or below 100% of the poverty threshold	US Census Bureau. <i>American Community Survey</i> , 2014
	Volunteerism	Percentage of adults aged 65 and older who report volunteering through or for an organization in the past 12 months	Corporation for National & Community Service, 2012-2014
	Nursing Home Quality	Percentage of certified nursing home beds rated 4- or 5-stars (2015 revised CMS definition)	Centers for Medicare & Medicaid Services (CMS). <i>Nursing Home Compare</i> , 2016
Community & Environment Micro	Home-Delivered Meals	Number of persons served a home-delivered meal as a percentage of adults aged 65 and older living in poverty	Numerator: Administration on Aging (AoA). <i>State Program Reports</i> , 2013 Denominator: US Census Bureau. <i>American Community Survey</i> , 2013**
	Food Insecurity	Percentage of adults aged 60 and older who faced the threat of hunger in the last 12 months	National Foundation to End Senior Hunger. <i>The State of Senior Hunger in America 2013: An Annual Report</i> , April 2015
	Community Support	Total expenditures captured by the Administration on Aging per adult aged 65 and older living in poverty	Numerator: AoA. <i>State Program Reports</i> , 2013 Denominator: US Census Bureau. <i>American Community Survey</i> , 2013**

Policy

Measure	Description	Source, Data Year(s)
Low-Care Nursing Home Residents	Percentage of nursing home residents who were low-care, according to the broad definition (no physical assistance required for late-loss activities of daily living)	Brown University, <i>Shaping Long Term Care in America Project</i> , 2014
Prescription Drug Coverage	Percentage of adults aged 65 and older who have a creditable prescription drug plan	The Henry J Kaiser Family Foundation, <i>State Health Facts</i> , 2012
SNAP Reach	Number of adults aged 60 and older who participate in Supplemental Nutrition Assistance Program (SNAP) as a percentage of adults aged 60 and older living in poverty	Numerator: US Department of Agriculture, Food and Nutrition Service, 2014 Denominator: US Census Bureau. <i>American Community Survey</i> , 2014**
Geriatrician Shortfall*	Percentage of geriatricians required to meet estimated need	The American Geriatrics Society, 2015

Clinical Care

Measure	Description	Source, Data Year(s)
Dedicated Health Care Provider	Percentage of adults aged 65 and older who self-report having a personal doctor or health care provider	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
Flu Vaccine	Percentage of adults aged 65 and older who self-report receiving a flu vaccine in the last year	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
Health Screenings	Percentage of adults aged 65 to 74 who self-report having a mammogram and/or fecal occult/colonoscopy/sigmoidoscopy screens within the recommended time period	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
Recommended Hospital Care	Percentage of hospitalized patients aged 65 and older who received the recommended care for heart attack, heart failure, pneumonia, and surgical procedures	Improving Healthcare for the Common Good. WhyNotTheBest.org, March 1, 2016 (based on data from Q1/2014-Q4/2014)
Diabetes Management	Percentage of Medicare beneficiaries aged 65 to 75 with diabetes receiving a blood lipids test	The Dartmouth Atlas of Health Care, 2013
Home Health Care	Number of personal care and home health aides per 1,000 adults aged 75 and older	Numerator: Bureau of Labor Statistics, 2015 Denominator: US Census Bureau. <i>American Community Survey</i> , 2014
Preventable Hospitalizations	Number of discharges for ambulatory care-sensitive conditions per 1,000 Medicare beneficiaries	The Dartmouth Atlas of Health Care, 2013
Hospital Readmissions	Percentage of patients aged 65 and older who were readmitted within 30 days of discharge	The Dartmouth Atlas of Health Care, 2013
Hospice care	Percentage of decedents aged 65 and older who were enrolled in hospice during the last 6 months of life after diagnosis of condition with high probability of death	The Dartmouth Atlas of Health Care, 2013
Hospital Deaths	Percentage of decedents aged 65 and older who died in a hospital	The Dartmouth Atlas of Health Care, 2013

* The data appearing in this edition are the same that appeared in the 2015 edition. An update was not available at the time of this publication.

** *American Community Survey* discontinued 3-year estimates; the data used in this edition are based on single-year data estimates.

Appendix

TABLE 8

Description of Core Measures, *continued*

Measure	Description	Source, Data Year(s)
ICU Use	Percentage of decedents aged 65 and older spending 7 or more days in the intensive care or critical care unit during the last 6 months of life	The Dartmouth Atlas of Health Care, 2013
Hip Fracture	Rate of hospitalization for hip fracture per 1,000 Medicare beneficiaries	The Dartmouth Atlas of Health Care, 2013
Falls	Percentage of adults aged 65 and older who self-report having had a fall in the past 12 months (2012 definition)	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
Health Status	Percentage of adults aged 65 and older who self-report very good or excellent health	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
Able-Bodied**	Percentage of adults aged 65 and older with no disability	US Census, <i>American Community Survey</i> , 2014
Premature Death	Number of deaths per 100,000 adults aged 65 to 74	CDC. National Center for Health Statistics, 2014
Teeth Extractions	Percentage of adults aged 65 and older who self-report having had all teeth removed due to tooth decay or gum disease	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014
Frequent Mental Distress	Percentage of adults aged 65 and older who self-report their mental health was not good 14 or more days during the past 30 days	CDC. <i>Behavioral Risk Factor Surveillance System</i> , 2014

* The data appearing in this edition are the same that appeared in the 2015 edition. An update was not available at the time of this publication.

** *American Community Survey* discontinued 3-year estimates; the data used in this edition are based on single-year data estimates.

TABLE 9

Description of Supplemental Measures

	Measure	Description	Source, Data Year(s)
Behaviors	Education	Percentage of adults aged 65 and older with a college degree	US Census Bureau, <i>American Community Survey</i> , 2014**
Clinical Care	Overuse – Mammography	Percentage of female Medicare beneficiaries aged 75 and older who had at least one screening mammogram	The Dartmouth Atlas of Health Care, 2012
	Overuse – PSA Test	Percentage of male Medicare beneficiaries aged 75 and older who received a screening PSA test	The Dartmouth Atlas of Health Care, 2012
Outcomes	Multiple Chronic Conditions	Percentage of Medicare beneficiaries aged 65 and older with 4 or more chronic conditions	Centers for Medicare & Medicaid Services, 2014
	Cognition**	Percentage of adults aged 65 and older who report having a cognitive difficulty	US Census Bureau, <i>American Community Survey</i> , 2014
	Depression	Percentage of adults aged 65 and older who were told by a health professional that they have a depressive disorder	Centers for Disease Control and Prevention (CDC), <i>Behavioral Risk Surveillance Factor System</i> , 2014
	Suicide	Number of deaths due to intentional self-harm per 100,000 adults aged 65 and older	CDC, National Center for Health Statistics, 2012-2014

Methodology

For each measure, the raw data are obtained from secondary sources and presented as “value.” The score for each state is based on the following formula:

$$\text{Score} = \frac{\text{State value} - \text{national value}}{\text{Standard deviation of all state values}}$$

This z score indicates the number of standard deviations a state is above or below the national value. A 0.00 indicates a state has the same value as the nation. States with higher values than the national value have a positive

score; states below the national value have a negative score. To prevent an extreme score from exerting excessive influence, the maximum score for a measure is capped at +/- 2.00. If a US value is not available for a measure, the mean of all state values is used. Overall score is calculated by adding the scores of each measure multiplied by its assigned weight (the percentage of total overall ranking). See Table 10 for model category weights. The model category weight is distributed equally among all measures within each category.

The overall ranking is the ordering of each state according to the overall score. The ranking of individual measures is the ordering of each state according to the measure’s value. Ties in values are assigned equal ranks. Not all changes in rank are statistically significant.

Population Growth Projections Methodology

Woods and Poole projections are based on models of county population growth and migration due to economic conditions. The average absolute percent error for Woods and Poole's ten year total population projections has been $\pm 4.0\%$ for states.

Comparison of Health Estimates in the Middle-Aged Population Methodology

The prevalence of obesity, diabetes, smoking and very good or excellent health status were examined in the middle-aged population (adults aged 50–64) using 1999 and 2014 Behavioral Risk Factor Surveillance System (BRFSS) data. The 15 year relative change in these four measures was calculated. Missing data were excluded from this analysis, which includes "don't know," "not sure," "refused," and blank or missing responses.

Limitations

For the measures, comparisons between estimates before and after 2011 should be approached with caution due to changes in BRFSS methodology. In 2011, BRFSS added cellular telephone-only households and a new method of weighting the data. The addition of cellular telephone only households has disproportionately increased the numbers of certain population groups represented in the survey, and the weighting change has increased prevalence estimates of certain

chronic disease estimates, such as diabetes and obesity; Thus, some of the increase seen since 1999 in diabetes and obesity prevalence and some of the decrease seen since 1999 in smoking and health status prevalence could be attributed to the new methods implemented in 2011.⁵ Please refer to the following CDC website for more information on the 2011 methodological changes: <http://www.cdc.gov/surveillancepractice/reports/brfss/brfss.html>.

2016 Model Development

The measures and model for *America's Health Rankings® Senior Report* were developed by a panel of experts in the field of senior health for the inaugural edition in 2013. The panel was charged with identifying the areas of health and well-being most pertinent to the older adult population and developing a model for assessing population health at a state level.

In March 2016, the panel convened by telephone and reviewed each measure included in the 2015 edition. Panelists recommended that the following items be explored:

1. Home and Community Based Services (HCBS) waiver waitlists: Waitlists depend heavily on size of state HCBS program and state population, and some states don't have waivers. This measure is difficult to rank at this time and will be revisited in future years.
2. Out-of-pocket spending: This measure is lacking data at the state level. Consider exploring bankruptcy, medical impoverishment, and other equivalent measures.
3. Overuse of clinical care: Consider adding prostate-specific antigen (PSA) testing among men aged 75 and older and mammography among women aged 75 and older.
4. Wellness visits: Potential issues exist with the definition and data validity. Consider adding as a supplemental measure and explore other possible measures such as the Medicare benefit paid to primary care physicians who counsel seniors with obesity during a 15-minute weight loss visit.
5. Social support, social isolation, medication adherence, and elder abuse: All areas lack comparable state-level data and will be revisited in future years.
6. Transportation: Explore potential measures (eg, lack of reimbursement).
7. Diet and/or nutrition: Identify improved measure(s).

Changes implemented in 2016:

- Replaced chronic drinking, a core behaviors measure, with excessive drinking—a combined chronic drinking and binge drinking measure (page 26).
- Replaced poor mental health days, a core outcomes measure, with frequent mental distress (page 72).
- Added clinical overuse — PSA among men aged 75 and older and clinical overuse — mammography among women aged 75 and older, supplemental clinical care measures, as proxies for overuse of clinical care services (pages 68–69).
- The supplemental measure prescription drug plans with a gap is no longer available and was removed.
- The *American Community Survey* discontinued 3-year estimates. The measures poverty and able-bodied, as well as the denominators for home-delivered meals, community support, and SNAP reach, are based on a single year of data in this edition.

2016 Senior Health Advisory Group

The Senior Health Advisory Group members include:

Soo Borson, MD
Professor Emerita, University of Washington
School of Medicine
Dementia Care Research and Consulting

Randy Brown, PhD
Director of Health Research
Mathematica Policy Research

Julie Bynum, MD, MPH
Associate Professor of The Dartmouth Institute
Associate Professor of Medicine
Associate Director, Center for Health Policy
Research
The Dartmouth Institute for Health Policy &
Clinical Practice
Geisel School of Medicine at Dartmouth

Tom Eckstein, MBA
Principal and author, *America's Health Rankings*[®]
Arundel Metrics, Inc

Sarah Milder, MPH
Epidemiologist and author, *America's Health
Rankings*[®]
Arundel Metrics, Inc

Rhonda Randall, DO
Chief Medical Officer
UnitedHealthcare Retiree Solutions

Barbara Resnick, PhD, RN, CRNP, FAAN, FAANP
Professor of Nursing
Chairman of the Board, American Geriatrics
Society
Sonya Ziporkin Gershowitz Chair in Gerontology
University of Maryland

Anna Schenck, PhD, MSPH
Professor of the Practice, Associate Dean for
Practice
Director, Public Health Leadership Program and
the North Carolina Institute for Public Health
UNC Gillings School of Global Public Health
University of North Carolina at Chapel Hill

Lynn Shaull, MA
Director, Health Improvement
Association of State and Territorial Health Officials

Denise Tyler, PhD
Assistant Professor of Health Services, Policy and
Practice
Brown University

Elizabeth Walker Romero, MS
Senior Director, Health Improvement
Association of State and Territorial Health Officials

The Team

America's Health Rankings® Senior Report is a team effort in which all contribute a vital part to the creation and dissemination of this report. Members of this team, listed alphabetically by organization, follow:

America's Health Rankings® Expansion

The expansion of *America's Health Rankings*® in 2016 is two-fold, two major population-level reports will be introduced along with a series of Spotlight reports.

America's Health Rankings® *Maternal and Child Health Report* will be the focus of the first new population-level report. In this report, *America's Health Rankings*® will provide a holistic scorecard of the health of women of reproductive age, health during pregnancy, and infant and child health. Like the *Senior Report*, it will contain measures on behaviors, community & environment, policy, clinical care, and outcomes for each state.

America's Health Rankings® *Veterans' Health* will debut second and will focus on the behavioral differences between those who provide service to the country and the general population.

The first two Spotlights have already been released; *Spotlight: Prevention* focuses on the variation of clinical prevention measures across the states and *Spotlight: Impact of Unhealthy Behaviors* quantifies the impact of multiple unhealthy behaviors on the population's overall health status. Additional Spotlights will be forthcoming. The Spotlights complement, leverage, and amplify the information contained in the larger population reports.

Guided by a passion to help people live healthier lives, United Health Foundation provides helpful information to support decisions that lead to better health outcomes and healthier communities. The Foundation also supports activities that expand access to quality health care services for those in challenging circumstances and partners with others to improve the well-being of communities.
